All LAMS reports are informal documents, usually prepared for a special purpose and primarily prepared for use within the Laboratory rather than for general distribution. This report has not been edited, reviewed, or verified for accuracy. All LAMS reports express the views of the authors as of the time they were written and do not necessarily reflect the opinions of the Los Alamos Scientific Laboratory or the final opinion of the authors on the subject.

## **ABSTRACT**

**Tabulated are critical masses of simple systems, which  
have been measured at Los Alamos through the year 1963.**

## INTRODUCTION

Numerous Los Alamos critical mass data have been published only as points on curves, frequently after adjustment to "standard" conditions (e.g., to uniform values of U<sup>235</sup> enrichment and density), and usually without indication of reliability. Under these conditions, original data tend to become lost. It is the purpose of this compilation to retrieve original critical masses and to give some means of judging the quality of measurements.

Indexes of accuracy are probable error, if it has been estimated, the maximum mass of fissile material used in the measurement, or the maximum central-source neutron multiplication attained. For nonhydrogenous systems a multiplication of 10 usually corresponds to a core mass that is 70% to 80% of critical, 20 corresponds to 85% to 90% of the critical mass, 50 corresponds to 93% to 97%, and 100 corresponds to 96-1/2% to 98-1/2%. Generally, the probable error in critical mass is about one-quarter of the difference between the critical mass value and the maximum mass employed. This estimate may be valid down to an indicated probable error of 1% to 2%, beyond which the probable error is usually controlled by the precision with which the composition and geometry of the system can be described. Maximum multiplication is not a reliable index of accuracy for hydrogen-moderated assemblies because of the severe influence of neutron-spectral distortion.

Not included in this compilation are several critical assemblies that cannot be described adequately by simple entries in tables (e.g., assemblies with nonuniform cores). Also omitted are a few critical mass estimates for which the maximum mass used was less than three-quarters of the critical value.

The following symbolism appears in the tables of critical masses:

$m_c$  - critical mass of core

$m_{max}$  - maximum mass used, in same units as  $m_c$

$M_{max}$  - maximum central source neutron multiplication attained

$h_c$  - critical height of cylindric core

d - diameter of core

L x H x W - length times height times width of parallelepiped

$\rho$  - density

w/o - weight percent

v/o - volume percent

U(93) - enriched uranium containing 93 w/o U<sup>235</sup>

U(N) - uranium with natural isotopic composition

TABLE IAL

## HIGHLY ENRICHED U METAL, UNREFLECTED

Corrected empirically for influence of supports and small (~0.4") source cavity unless noted otherwise

reference	shape	components	material	$\bar{\rho}$ (total U) (g/cm <sup>3</sup> )	$h_c/d$	$m_c$ (kg U <sup>235</sup> )	$m_{max}$ (kg U <sup>235</sup> )	$M_{max}$
(1)	sphere <sup>a</sup>	thick sections	U(93.8)	18.75	-	48.8 ± 1/2%	critical	
(2)	sphere	thick shells	U(93.9)	18.75	-	48.7 ± 1/2%		142
(3)	pseudosphere	~0.4" rings <sup>b</sup>	U(93.9)	18.5 ± 0.1	-	50.9	49.8	150
(4)	pseudosphere	~0.4" rings <sup>b</sup>	U(93.9)	18.5 ± 0.1	-	50.6	50.0	180
(4)	cyl 4.75" dia	~0.4" rings <sup>b</sup>	U(93.8)	18.5 ± 0.1	-	>94	70.8	13
(4)	cyl 5.50" dia	~0.4" rings <sup>b</sup>	U(93.8)	18.5 ± 0.1	1.76	66.2	61.4	96
(4)	cyl 6.37" dia	~0.4" rings <sup>b</sup>	U(94.0)	18.5 ± 0.1	0.95	55.3	52.6	85
(4)	cyl 7.00" dia	~0.4" rings <sup>b</sup>	U(94.0)	18.5 ± 0.1	0.72	55.6	54.0	76
(4)	cyl 7.50" dia	~0.4" rings <sup>b</sup>	U(94.0)	18.5 ± 0.1	0.61	58.2	55.9	54
(5)	cyl 15.00" dia	0.3 cm plates	U(93.3)	17.9	0.214	155.3 ± 0.6	151	67
(5)	cyl 21.00" dia	0.3 cm plates	U(93.2)	17.9	0.141	281.2 ± 0.7	270	68

<sup>a</sup> Corrected for slight asphericity<sup>b</sup> Uncorrected for 0.06 in.<sup>3</sup> central source cavity; corrected empirically for effect of supports

TABLE IA2

## U(93.4) - U(N) METAL CYLINDERS, UNREFLECTED

Indicated layers are combinations of 10.5" diameter, 0.8 cm thick U(93.4), and 0.6 cm thick U(N)

Corrected from partial terminating sandwich to fractional sandwich of proper composition

Corrected for reflection effect of support

All systems critical

Reference (6)

TABLE IB3

MISCELLANEOUS ENRICHED U METAL, U(N) REFLECTOR<sup>a</sup>

reference	core	reflector	$\frac{m_c}{kg \text{ U}^{235}}$
(14)	annulus, 12.25" o.d. x 6.00" i.d. x 3.01" high, stack of 1/2" and 1/4" thick rings U(93.4), $\bar{\rho}(U) = 18.7 \text{ g/cm}^3$	1.00" thick, $\bar{\rho} = 19.0 \text{ g/cm}^3$ , completely envelops core	$77.2 \pm 0.3$ ( $m_{\max} > m_c$ ) <sup>b</sup>
(14)	annulus, 12.25" o.d. x 6.00" i.d. x 2.03" high, stack of 1/2" and 1/4" thick rings U(93.4), $\bar{\rho}(U) = 18.7 \text{ g/cm}^3$	3.00" thick, $\bar{\rho} = 19.0 \text{ g/cm}^3$ , completely envelops core	$52.2 \pm 0.3$ ( $m_{\max} = 51.6$ )
(15)	pseudocylinder, 13.74" av dia x 12.00" av compo- sition: <sup>c</sup> 18.1 v/o U(93.6), $\bar{\rho} = 3.38 \text{ g/cm}^3$ ; 13.6 v/o U(N), $\bar{\rho} = 2.58 \text{ g/cm}^3$ ; 11.8 v/o Fe, $\bar{\rho} = 0.92 \text{ g/cm}^3$ ; 52.3 v/o Al, $\bar{\rho} = 1.40 \text{ g/cm}^3$ ; 4.2 v/o void	pseudocylinder 5.0" av thickness, $\bar{\rho} = 18.9 \text{ g/cm}^3$	93.0 ( $M_{\max} = 225$ )

<sup>a</sup> Unlisted, is a nonuniform assembly of mixed plates and rings of U(93.4) and U(N) that enclose a near-central cylindrical cavity, 15.0" dia x 11.8"; outside dimensions of the assembly are 21.0" dia x ~21" high (S. J. Balestrini, G. A. Jarvis, J. D. Orndoff, December 1961). Average composition bounding cavity is U(27), ~4-1/2" thick U(N) rings form top and bottom of cylinder. At critical, the total mass is ~1400 kg U(N) and 339 kg U(93.4). Uncorrected for 1/4" thick steel plate supporting portion above cavity.

<sup>b</sup> Corrected for small gap between assembly halves

<sup>c</sup> Average thickness of core discs, blocks, and shaped Al fillers: U(93.6) ~0.4", U(N) ~0.3", Fe ~0.25", Al ~0.9"
