All LAMS reports are informal documents, usually prepared for a special purpose and primarily prepared for use within the Laboratory rather than for general distribution. This report has not been edited, reviewed, or verified for accuracy. All LAMS reports express the views of the authors as of the time they were written and do not necessarily reflect the opinions of the Los Alamos Scientific Laboratory or the final opinion of the authors on the subject.

ABSTRACT

A neutron transport equation which was solved numerically (the SNG code by B. Carlson) has been connected with multigroup neutron cross sections and critical assemblies to display the area of coverage (fast to epithermal reactors) and range of errors ($\Delta k \approx \pm 1\%$). The cross sections, critical assemblies, and results are tabulated.

INTRODUCTION

A continuing effort has been made to generalize neutron cross sections in reactor physics for a very wide variation in neutron flux distribution, i.e., for a very wide variation in reactor size and materials. It is demonstrated in an accompanying note that intermediate reactors are tractable; work by R. Kiehn, G. Hansen and others has shown that fast reactors are tractable. The complete set of possible nuclear reactors is of interest here.

METHOD

The equations used in this study are only the familiar multi-group numerical form of the transport equation known as the SNG equations of Carlson.¹ Diffusion theory results will be reported separately. The associated number and description of fast neutron flux groups proposed to be most general and to make best use of the recent

¹B. G. Carlson, "Solution of the Transport Equation by S_n Approximations," LA-1891, Ofc. of Technical Services, Dept. of Commerce.

work of Hansen, Kiehn, and Bell is shown on Table I. This table leans heavily on the technical notes of Hansen and Roach² for the higher energy groups 1-6 of the 18 group intermediate reactor set both because of the care with which the group energy limits, etc., were chosen and because of the relative absence of systematic errors.

The complex of neutron cross sections, computing code, and "clean" basic critical experiment is displayed in part in Tables II, containing neutron cross sections, Tables III containing experiments, and Tables IV containing a set of critical experiment calculations. The fast reactor experiments were chosen to provide adequate coverage of a wide variety of fast systems and the intermediate systems were chosen to represent extremes in intermediate reactor parameters for each different moderator. Tables II, the microscopic neutron cross sections, are subject to revision and extension as the systematic study of the experiments in Tables III is developed and as new data appears. Safety experiments and calculations are included to illustrate the extreme versatility of the data and methods.

COMPUTING PROCEDURE

The operational procedure is to compute all reactors with

²L. A. Tech. Notes, N-2-731 and 753 by G. Hansen and W. Roach.

existing neutron cross sections constructed from available tabulations (Bell, Hansen, Kiehn, and Mills), as derived from the many sources of cross section values (see cross section bibliography) consistent with Table I. Systematic errors then force changes in the light of theoretical work of Beyster et al., BNL-325, etc., and other sources such as reactor experiments. A sufficiently wide change of parameters (composition and size) of the reference reactor critical experiments essentially weights different energy regions of the neutron cross sections in an integral way, because of the large change in flux spectrum ($\phi(u)$ or $\phi(E)$) from system to system as well as in various positions in one reactor. Thus a display of k_{eff} for each of a small number but a wide variety of reactors is sufficient as a first order validation of the accuracy of the energy dependence of the neutron cross sections of the materials in an integral sense. More detail is possible by foil activation and material (element) reactivity and reactivity distribution.

NEUTRON CROSS SECTIONS

The group averaged fast (10^7 to 10^3 ev) neutron cross sections for the heavy elements are those evolved by G. Hansen and W. Roach in their fast reactor study.* These could not be improved by a careful

* This is in process of publication.

study and were accepted in toto. A. Green is presently engaged in a theoretical development of fast neutron differential cross sections and may be able to improve this set.

Neutron cross sections in the light elements used as moderators were evolved by conventional procedures, weighted by neutron flux spectra. Resonance analyses by J. Devaney and G. Bell permitted facile inclusion of these very troublesome numbers. The restrictions implied by 1-dimensional computing methods were relieved in part by a simple "equivalent escape probability" for the second dimension in slab or cylindrical systems.

In spite of the great volume of work available in reactor physics, still "the proof of the pudding is in the eating," so a laborious justification of the group averaged neutron cross sections evolved will not be attempted. Possibly in the not too distant future the basic numbers will be in sufficient supply to justify more exact methods and treatment.

REACTOR CRITICAL ASSEMBLIES

The fast reactor critical assemblies were supplied by G. Hansen; the fast reactor "safety" experiments were found in a summary by H. Paxton.³ Intermediate reactors studied are described with appropriate

³H. C. Paxton, "Critical Masses of Fissionable Metals as Basic Nuclear Safety Data," LA-1958 (1955).

references (through the present writer, when no cross check by the originating person was possible) from the literature.

The existence of possibly correct neutron flux distributions (also see LAMS-2240) for a wide variety of reactor critical experiments is of interest to those groups limited to one or few group methods for few group averaged neutron cross sections. For this reason, the energy and space distribution of neutron flux in these systems is presented below.

It should be emphasized that in a sense all of the reactors herein described are implicit in the neutron cross sections displayed and the numerical computing code. There is then an infinity of reactors both interpolated and extrapolated (but not too far) implicit in the same sense, and novel or developed systems can be analyzed and predicted in detail with confidence consistent with the small systematic errors herein displayed. Clearly, more clean systems should be studied to decrease these errors.

SUMMARY

The compilations of neutron cross sections and the available reasonably clean basic reactor critical assemblies have been coordinated by the SNG transport approximation. It is apparent in studying the tabulated results that few reactor critical assemblies can be considered either "clean" or "basic." Within the normal uncertainties in studies

of this sort the entire set can be considered consistent. The group averaged neutron cross sections are shown to have approximately second order accuracy, so that more detailed experimental analyses of moderated systems is in order. In this connection, the "speed up" probabilities of neutrons moving from the cold to hot regions of reactors, computed by J. G. Griffin (LASL), are added to the cross section tabulation without validation to assist in evaluation of the thermal flux distribution in high temperature critical assemblies.

TABLES III
CRITICAL EXPERIMENTS

A. Safety Critical Experiments

This set of critical system specifications was obtained from a Nuclear Safety Data tabulation⁽³⁾ by H. C. Paxton. The central region was Oralloy; the reflectors vary in thickness and material.

	Core Rad. (cm)	Refl. Rad.(cm)	Refl. Density(gm/cc)	$k_{\text{eff}} (S_4)$

TABLES III
CRITICAL EXPERIMENTS

B. Clean Critical Experiments

1. Fast clean systems.

These systems were abstracted from LA safety measurements by Hansen.

Date Feb. 1958

Name Godiva

Laboratory LASL

Classification of data Unclass.

Critical Experiment Summary Sheet

1. Reactor Shape (Sketch)

$$M_c = 51.9 \text{ kg } 93.9\% \text{ Oy at } 18.75 \text{ gm/cm}^3$$

2. Elements in each region

Region		1	2	3	4	5	6	...
Element								
Name	Vol. fraction* or atomic density							
U-235	1	0.04511						
U-238	2	0.00245						
U-234	3	0.00045						
	4							
	5							
	6							
	7							
Radius or thickness of each region								

* Material density required

3. Supplementary information (e.g., foil spacing and thickness, uranium enrichment, impurities, power distribution, etc.; may be on supplementary sheets).

Date Feb. 1958Name 16 1/4% JemimaLaboratory LASLClassification of data Unclass.

Critical Experiment Summary Sheet

1. Reactor Shape (Sketch)

2. Elements in each region

$$t = 3" \text{ Tu}; h = 32.36 \text{ cm}; r = 19.05 \text{ cm}$$

$$\rho_c = 18.75 \text{ gm/cm}^3 (M_c = 692 \text{ kg})$$

Equivalent sphere: With $\lambda_{\text{cyl.}} = 2.70"$, $B^2 = 0.01327 \text{ cm}^{-2}$; with $\lambda_{\text{sph.}} = 2.74"$, $R_{\text{sph.}} = 20.32 \text{ cm}$ core radius, 7.62 cm reflector thickness. This gives

$$M_c = 657 \text{ kgm}; R_1 = 20.32 \text{ cm}, R_2 = 27.94 \text{ cm.}$$

Region		1	2	3	4	5	6	...

CRITICAL EXPERIMENT CALCULATIONS

These experiments are presented as computed because of the general interest in neutron flux spectra for a wide variety of reasonably clean systems. Safety calculations are omitted since the set of specifications are the best interpolations reasonably possible between the actual systems, many of which are presented on Table III B and computed results shown on this tabulation.

A brief summary of computed k_{eff} values is as follows:

Godiva*	(93.4 per cent U ²³⁵)	L.A.	1.00	
Jemima*	(37.5 per cent U ²³⁵)	"	.98	
Jemima*	(16.25 per cent U ²³⁵)	"	.98	
H ₂ O	1 H/U ²³⁵ = 900 (H ₂ O refl.)	ORNL	1.01	
	2 H/U ²³⁵ = 300 (H ₂ O refl.)	"	1.03	
	3 H/U ²³⁵ = 53(bare)	"	.98	
D ₂ O	1 D/U ²³⁵ = 230 (bare)	L.A.	1.00	
	2 D/U ²³⁵ = 2081 (bare)	"	1.01	
	3 D/U ²³⁵ = 34.2 (refl.)	"	.98	
	4 D/U ²³⁵ = 135.3 (refl.)	"	.98	
Be	1 Be/U ²³⁵ = 364 (bare)	ORNL	.99	10 mil foil
	2 Be/U ²³⁵ = 1546 (bare)	ORNL	1.00	10 mil foil
C	1 C/U = 675 B ² = 21.64 x 10 ⁻⁴	LRL	.99	
	2 C/U = 1379 20.68 x 10 ⁻⁴	"	.99	
	3 C/U = 2569 19.0 x 10 ⁻⁴	"	.98	
CA-4	C/U = 1063 (bare)	ORNL	1.01	10 mil foil

*S₈ calculations for these three systems reduces k_{eff} by $\Delta k = -.0045$, $-.0027$, and $-.0012$ respectively.
