## ABSTRACT

A method is given for estimating fractional yields of products from low- and medium-energy neutron induced fission. The method is based on experimental measurements of some fractional independent and cumulative yields, and involves the assumption that yields of products along beta-decay chains are described by a Gaussian function with the same width ( $\sigma$ ) for all mass numbers.

Equations are given for estimating  $Z_p$ , "the most probable charge." Fractional yields may be obtained from a table which lists fractional yields as a function of  $Z - Z_p$ .

Although cumulative yields of many long-lived, late members of fission product chains are known for a number of fission processes from experimental measurements, the yields of most of the short-lived, earlier members have not been measured. The measured fractional yields for thermal neutron fission of  $U^{233}$ ,  $U^{235}$ , and  $Pu^{239}$  and for 14-MeV neutron fission of  $U^{235}$  and  $U^{238}$  are summarized in references 1 and 2. The purpose of this report is to present the necessary equations and tables for making rapid predictions of fractional yields from low- and medium-energy neutron induced fission. To make such a prediction by the method given here, one first estimates a value of  $Z_p$ , the value of  $Z$  for the maximum of the independent yield versus  $Z$  curve, for the mass number of the fission process of interest. A charge dispersion curve is then used to estimate the fractional yield of element  $Z$  for that mass number. The reader should consult references 1 - 4 for discussion and derivation of the method described below.

$Z_p$  values for thermal neutron fission of  $U^{235}$  are used as reference values for given mass numbers, and adjustments are made for other fission processes. For high-yield mass numbers,  $Z_p^{\text{ref}}$ , the reference  $Z_p$ , is approximated by:<sup>2,3</sup>

$$Z_p^{\text{ref}} = 0.4237A - 2.19 \quad (\text{for } 82 < A < 100)$$

and

$$Z_p^{\text{ref}} = 0.4331A - 6.06 \quad (\text{for } A > 135) \quad (1)$$

where  $A$  is the mass number. Not enough measurements have been made for

low-yield mass numbers to make such generalizations.

The following equations are then used to adjust  $Z_p^{\text{ref}}$  for a different fission process:<sup>4</sup>

$$\Delta Z_p = 0.5 (Z_F - 92) - 0.21 (A_F - 236) + 0.19 (v_T - 2.43) \quad (2)$$

and

$$Z_p = Z_p^{\text{ref}} + \Delta Z_p \quad (3)$$

where  $Z_F$  is the charge of the fissioning nucleus,  $A_F$  is the initial mass of the compound nucleus (i.e., the mass of the target nucleus plus one), and  $v_T$  is the average number of neutrons per fission. Values of  $v_T$  are obtained from equation 4:<sup>5</sup>

$$v_T = \bar{v}(\text{thermal}) + kE \quad (4)$$

in which  $E$  is the incident neutron energy. Values of the constants are given in Table I.

TABLE I

Constants for Equation 4<sup>a</sup>

<u>Process</u>	<u><math>\bar{v}(\text{thermal})</math></u>	<u><math>k</math></u>
$U^{239}(n,F)$	2.50	0.115
$U^{235}(n,F)$	2.43	0.135
$U^{238}(n,F)$	2.41	0.138
$Pu^{239}(n,F)$	2.87	0.111

<sup>a</sup>From reference 5.

Table II lists values of  $\Delta Z_p$  for some common fission processes; others can be calculated easily.

TABLE II

Values of  $\Delta Z_p$

Process	$\Delta Z_p$
$U^{233}(n_{th}, F)$	0.43
$Pu^{239}(n_{th}, F)$	0.25
$U^{235}(n_{14.6}, F)$	0.37
$U^{238}(n_{14.6}, F)$	- 0.25

The fractional cumulative yield of a nuclide with charge  $Z$  is given by the Gaussian equation:

$$\sum_0^Z (P_n) = \frac{1}{\sigma(2\pi)^{\frac{1}{2}}} \int_0^{Z+0.5} \exp \left[ -\frac{(n - Z_p)^2}{2\sigma^2} \right] dn \\ = 0.5 + 0.5 f \left[ (Z - Z_p + 0.5)/\sqrt{2}\sigma \right] \quad (5)$$

in which  $f(Y)$  is the error function, defined by the expression

$$f(Y) = \frac{2}{\sqrt{\pi}} \int_0^Y \exp(-t^2) dt \quad (6)$$

which can be readily evaluated on a computer.<sup>6</sup> A value of  $\sigma$  of  $0.59 \pm 0.06$  is assumed to apply for all mass numbers from low- and medium-energy neutron induced fission.<sup>1-3</sup> Table III lists values of fractional independent and cumulative yields as a function of  $(Z - Z_p)$  for values of

$\sigma$  of 0.59, 0.53, and 0.65.

To estimate a fractional yield, perform the following steps:

1. Calculate  $Z_p^{\text{ref}}$  from equation 1.
2. Determine  $v_T$  from equation 4 and Table I.
3. Determine  $\Delta Z_p$  from Table II or from equation 2.
4. Obtain  $Z_p$  through equation 3.
5. Look up the fractional yields for the proper value of  $(Z - Z_p)$  in Table III for each of the three  $\sigma$ 's.

For example, let us estimate the fractional yields of  $\text{Ba}^{142}$  from 14.0-MeV neutron fission of  $\text{U}^{238}$ :

$$A = 142, Z = 56, Z_F = 92, E = 14.0, A_F = 239$$

$$\text{From equation 1: } Z_p^{\text{ref}} = 55.44$$

$$\text{From equation 4 and Table I: } v_T = 4.34$$

$$\text{From equation 2: } \Delta Z_p = -0.27$$

$$\text{From equation 3: } Z_p = 55.17$$

$$Z - Z_p = 0.83$$

From Table III:

$$\text{Fractional independent yield} = \begin{cases} 0.276 & \text{for } \sigma = 0.59 \\ 0.261 & \text{for } \sigma = 0.53 \\ 0.285 & \text{for } \sigma = 0.65 \end{cases} \text{ i.e., } 0.276 + 0.009 \\ 0.276 - 0.015$$

$$\text{Fractional cumulative yield} = \begin{cases} 0.988 & \text{for } \sigma = 0.59 \\ 0.994 & \text{for } \sigma = 0.53 \\ 0.980 & \text{for } \sigma = 0.65 \end{cases} \text{ i.e., } 0.988 + 0.006 \\ 0.988 - 0.008$$

These two fractional yields with their uncertainties represent the fraction of the chain formed (after prompt neutron emission) at  $Z = 56$  and the fraction of the chain formed up to and including  $Z = 56$ , respectively.

A few words of caution in the use of this method are in order. The value of  $\sigma$  of  $0.59 \pm 0.06$  has been determined for thermal neutron fission of  $U^{235}$  for mass numbers 91 - 95 and 139 - 143;<sup>1,3</sup> the value is also consistent with three mass numbers from other fission processes.<sup>2</sup> It is assumed that the same Gaussian curve is valid for all mass numbers for the fission processes considered. This assumption was made in obtaining equation 1 from experimental data and is again made in estimating a yield from Table III. In reference 2 it is shown that the method of this report predicts most values of  $Z_p$ , which have been inferred from measurements of fractional yields, fairly successfully with the average deviation of the predicted  $Z_p$ 's from the measured  $Z_p$ 's being 0.11 charge unit. However, the  $Z_p$ 's predicted for mass numbers 89 - 95 from thermal neutron fission of  $Pu^{239}$  are consistently higher than those measured by an average of 0.17 charge unit.
