## FOREWORD

During its August 1991 Annual Business Meeting, the National Council of Examiners for Engineering and Surveying (NCEES) voted to make the Fundamentals of Engineering (FE) examination an NCEES supplied-reference examination. Then during its August 1994 Annual Business Meeting, the NCEES voted to make the FE examination a discipline-specific examination. As a result of the 1994 vote, the FE examination was developed to test the lower-division subjects of a typical bachelor engineering degree program during the morning portion of the examination, and to test the upper-division subjects of a typical bachelor engineering degree program during the afternoon. The lower-division subjects refer to the first 90 semester credit hours (five semesters at 18 credit hours per semester) of engineering coursework. The upper-division subjects refer to the remainder of the engineering coursework.

Since engineers rely heavily on reference materials, the FE Supplied-Reference Handbook will be made available prior to the examination. The examinee may use this handbook while preparing for the examination. The handbook contains only reference formulas and tables; no example questions are included. Many commercially available books contain worked examples and sample questions. An examinee can also perform a self-test using one of the NCEES FE Sample Questions and Solutions books (a partial examination), which may be purchased by calling (800) 250-3196.

The examinee is not allowed to bring reference material into the examination room. Another copy of the FE Supplied-Reference Handbook will be made available to each examinee in the room. When the examinee departs the examination room, the $F E$ Supplied-Reference Handbook supplied in the room shall be returned to the examination proctors.

The FE Supplied-Reference Handbook has been prepared to support the FE examination process. The FE Supplied-Reference Handbook is not designed to assist in all parts of the FE examination. For example, some of the basic theories, conversions, formulas, and definitions that examinees are expected to know have not been included. The FE Supplied-Reference Handbook may not include some special material required for the solution of a particular question. In such a situation, the required special information will be included in the question statement.

DISCLAIMER: The NCEES in no event shall be liable for not providing reference material to support all the questions in the FE examination. In the interest of constant improvement, the NCEES reserves the right to revise and update the FE Supplied-Reference Handbook as it deems appropriate without informing interested parties. Each NCEES FE examination will be administered using the latest version of the FE SuppliedReference Handbook.

## So that this handbook can be reused, PLEASE, at the examination site,

 DO NOT WRITE IN THIS HANDBOOK.

## UNITS

This handbook uses the metric system of units. Ultimately, the FE examination will be entirely metric. However, currently some of the problems use both metric and U.S. Customary System (USCS). In the USCS system of units, both force and mass are called pounds. Therefore, one must distinguish the pound-force (lbf) from the pound-mass (lbm).
The pound-force is that force which accelerates one pound-mass at $32.174 \mathrm{ft} / \mathrm{s}^{2}$. Thus, $1 \mathrm{lbf}=32.174 \mathrm{lbm}-\mathrm{ft} / \mathrm{s}^{2}$. The expression $32.174 \mathrm{lbm}-\mathrm{ft} /\left(\mathrm{lbf}-\mathrm{s}^{2}\right)$ is designated as $g_{\mathrm{c}}$ and is used to resolve expressions involving both mass and force expressed as pounds. For instance, in writing Newton's second law, the equation would be written as $F=m a / g_{\mathrm{c}}$, where $F$ is in lbf, $m$ in lbm, and $a$ is in $\mathrm{ft} / \mathrm{s}^{2}$.
Similar expressions exist for other quantities. Kinetic Energy: $K E=m v^{2} / 2 g_{\mathrm{c}}$, with $K E$ in ( $\mathrm{ft}-\mathrm{lbf}$ ); Potential Energy: $P E=m g h / g_{\mathrm{c}}$, with $P E$ in (ft-lbf); Fluid Pressure: $p=\rho g h / g_{\mathrm{c}}$, with $p$ in ( $\mathrm{lbf} / \mathrm{ft}^{2}$ ); Specific Weight: $S W=\rho g / g_{\mathrm{c}}$, in ( $\mathrm{lbf} / \mathrm{ft}^{3}$ ); Shear Stress: $\tau=$ $\left(\mu / g_{\mathrm{c}}\right)(d v / d y)$, with shear stress in $\left(\mathrm{lbf} / \mathrm{ft}^{2}\right)$. In all these examples, $g_{\mathrm{c}}$ should be regarded as a unit conversion factor. It is frequently not written explicitly in engineering equations. However, its use is required to produce a consistent set of units.
Note that the conversion factor $g_{c}\left[\mathrm{lbm}-\mathrm{ft} /\left(\mathrm{lbf}-\mathrm{s}^{2}\right)\right]$ should not be confused with the local acceleration of gravity $g$, which has different units $\left(\mathrm{m} / \mathrm{s}^{2}\right)$ and may be either its standard value $\left(9.807 \mathrm{~m} / \mathrm{s}^{2}\right)$ or some other local value.
If the problem is presented in USCS units, it may be necessary to use the constant $g_{\mathrm{c}}$ in the equation to have a consistent set of units.

| METRIC PREFIXES |  |  | COMMONLY USED EQUIVALENTS |
| :---: | :---: | :---: | :---: |
| Multiple | Prefix | Symbol |  |
| $10^{-18}$ | atto | a | 1 gallon of water weighs 8.34 lbf |

## MATHEMATICS

## STRAIGHT LINE

The general form of the equation is

$$
A x+B y+C=0
$$

The standard form of the equation is

$$
y=m x+b,
$$

which is also known as the slope-intercept form.
The point-slope form is

$$
\begin{array}{r}
y-y_{1}=m\left(x-x_{1}\right) \\
m=\left(y_{2}-y_{1}\right) /\left(x_{2}-x_{1}\right)
\end{array}
$$

Given two points: slope,
The angle between lines with slopes $m_{1}$ and $m_{2}$ is

$$
\alpha=\arctan \left[\left(m_{2}-m_{1}\right) /\left(1+m_{2} \cdot m_{1}\right)\right]
$$

Two lines are perpendicular if

$$
m_{1}=-1 / m_{2}
$$

The distance between two points is

$$
d=\sqrt{\left(y_{2}-y_{1}\right)^{2}+\left(x_{2}-x_{1}\right)^{2}}
$$

## QUADRATIC EQUATION

$$
\begin{aligned}
& a x^{2}+b x+c=0 \\
& \text { Roots }=\frac{-b \pm \sqrt{b^{2}-4 a c}}{2 a}
\end{aligned}
$$

## CONIC SECTIONS

$$
e=\text { eccentricity }=\cos \theta /(\cos \phi)
$$

[Note: $X^{\prime}$ and $Y^{\prime}$, in the following cases, are translated axes.]

## Case 1. Parabola $\quad e=1$ :

- 

$$
(v-k)^{2}=2 p(x-h) \text {; Center at }(h, k)
$$

is the standard form of the equation. When $h=k=0$, Focus: $(p / 2,0)$; Directrix: $x=-p / 2$

Case 2. Ellipse $\quad e<1$ :
-

$$
\frac{(x-h)^{2}}{a^{2}}+\frac{(y-k)^{2}}{b^{2}}=1 ; \quad \text { Center at }(h, k)
$$

is the standard form of the equation. When $h=k=0$,
Eccentricity: $e=\sqrt{1-\left(b^{2} / a^{2}\right)}=c / a$
$b=a \sqrt{1-e^{2}}$;
Focus: $( \pm a e, 0)$; Directrix: $x= \pm a / e$
Case 3. Hyperbola $\quad e>1$ :

is the standard form of the equation. When $h=k=0$,
Eccentricity: $e=\sqrt{1+\left(b^{2} / a^{2}\right)}=c / a$
$b=a \sqrt{e^{2}-1} ;$
Focus: $( \pm a e, 0) ;$ Directrix $x= \pm a / e$

- ©Brink, R.W., A First Year of College Mathematics, Copyright © 1937 by D. Appleton-Century Co., Inc. Reprinted by permission of Prentice-Hall, Inc., Englewood Cliffs, NJ.

Case 4. Circle $e=0$ :

$$
(x-h)^{2}+(y-k)^{2}=r^{2} ; \quad \text { Center at }(h, k)
$$

is the general form of the equation with radius
$r=\sqrt{(x-h)^{2}+(y-k)^{2}}$
-

Length of the tangent from a point. Using the general form of the equation of a circle, the length of the tangent is found from

$$
t^{2}=\left(x^{\prime}-h\right)^{2}+\left(y^{\prime}-k\right)^{2}-r^{2}
$$

by substituting the coordinates of a point $P\left(x^{\prime}, y^{\prime}\right)$ and the coordinates of the center of the circle into the equation and computing.

## Conic Section Equation

The general form of the conic section equation is

$$
A x^{2}+2 B x y+C y^{2}+2 D x+2 E y+F=0
$$

where not both $A$ and $C$ are zero.
If $B^{2}-A C<0$, an ellipse is defined.
If $B^{2}-A C>0$, a hyperbola is defined.
If $B^{2}-A C=0$, the conic is a parabola.
If $A=C$ and $B=0$, a circle is defined.
If $A=B=C=0$, a straight line is defined.

$$
x^{2}+y^{2}+2 a x+2 b y+c=0
$$

is the normal form of the conic section equation, if that conic section has a principal axis parallel to a coordinate axis.

$$
\begin{aligned}
& h=-a ; k=-b \\
& r=\sqrt{a^{2}+b^{2}-c}
\end{aligned}
$$

If $a^{2}+b^{2}-c$ is positive, a circle, center $(-a,-b)$.
If $a^{2}+b^{2}-c$ equals zero, a point at $(-a,-b)$.
If $a^{2}+b^{2}-c$ is negative, locus is imaginary.

## QUADRIC SURFACE (SPHERE)

The general form of the equation is

$$
(x-h)^{2}+(y-k)^{2}+(z-m)^{2}=r^{2}
$$

with center at $(h, k, m)$.
In a three-dimensional space, the distance between two points is

$$
d=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}+\left(z_{2}-z_{1}\right)^{2}}
$$

## LOGARITHMS

The logarithm of $x$ to the Base $b$ is defined by

$$
\log _{b}(x)=c, \text { where } \quad b^{c}=x
$$

Special definitions for $b=e$ or $b=10$ are:

$$
\begin{aligned}
& \ln x, \text { Base }=e \\
& \log x, \text { Base }=10
\end{aligned}
$$

To change from one Base to another:

$$
\log _{b} x=\left(\log _{a} x\right) /\left(\log _{a} b\right)
$$

e.g., $\ln x=\left(\log _{10} x\right) /\left(\log _{10} e\right)=2.302585\left(\log _{10} x\right)$

## Identities

$$
\begin{array}{ll}
\log _{b} b^{n} & =n \\
\log x^{c} & =c \log x ; x^{c}=\operatorname{antilog}(c \log x) \\
\log x y & =\log x+\log y \\
\log b & =1 ; \log 1=0 \\
\log x / y & =\log x-\log y
\end{array}
$$

## TRIGONOMETRY

Trigonometric functions are defined using a right triangle.
$\sin \theta=y / r, \cos \theta=x / r$
$\tan \theta=y / x, \cot \theta=x / y$
$\csc \theta=r / y, \sec \theta=r / x$

X
a
Law of Sines $\frac{a}{\sin A}=\frac{b}{\sin B}=\frac{c}{\sin C}$

## Law of Cosines

$a^{2}=b^{2}+c^{2}-2 b c \cos A$
$b^{2}=a^{2}+c^{2}-2 a c \cos B$
$c^{2}=a^{2}+b^{2}-2 a b \cos C$

## Identities

$\csc \theta=1 / \sin \theta$
$\sec \theta=1 / \cos \theta$
$\tan \theta=\sin \theta / \cos \theta$
$\cot \theta=1 / \tan \theta$
$\sin ^{2} \theta+\cos ^{2} \theta=1$
$\tan ^{2} \theta+1=\sec ^{2} \theta$
$\cot ^{2} \theta+1=\csc ^{2} \theta$
$\sin (\alpha+\beta)=\sin \alpha \cos \beta+\cos \alpha \sin \beta$
$\cos (\alpha+\beta)=\cos \alpha \cos \beta-\sin \alpha \sin \beta$
$\sin 2 \alpha=2 \sin \alpha \cos \alpha$
$\cos 2 \alpha=\cos ^{2} \alpha-\sin ^{2} \alpha=1-2 \sin ^{2} \alpha=2 \cos ^{2} \alpha-1$
$\tan 2 \alpha=(2 \tan \alpha) /\left(1-\tan ^{2} \alpha\right)$
$\cot 2 \alpha=\left(\cot ^{2} \alpha-1\right) /(2 \cot \alpha)$
$\tan (\alpha+\beta)=(\tan \alpha+\tan \beta) /(1-\tan \alpha \tan \beta)$
$\cot (\alpha+\beta)=(\cot \alpha \cot \beta-1) /(\cot \alpha+\cot \beta)$
$\sin (\alpha-\beta)=\sin \alpha \cos \beta-\cos \alpha \sin \beta$
$\cos (\alpha-\beta)=\cos \alpha \cos \beta+\sin \alpha \sin \beta$
$\tan (\alpha-\beta)=(\tan \alpha-\tan \beta) /(1+\tan \alpha \tan \beta)$
$\cot (\alpha-\beta)=(\cot \alpha \cot \beta+1) /(\cot \beta-\cot \alpha)$
$\sin (\alpha / 2)= \pm \sqrt{(1-\cos \alpha) / 2}$
$\cos (\alpha / 2)= \pm \sqrt{(1+\cos \alpha) / 2}$
$\tan (\alpha / 2)= \pm \sqrt{(1-\cos \alpha) /(1+\cos \alpha)}$
$\cot (\alpha / 2)= \pm \sqrt{(1+\cos \alpha) /(1-\cos \alpha)}$
$\sin \alpha \sin \beta=(1 / 2)[\cos (\alpha-\beta)-\cos (\alpha+\beta)]$
$\cos \alpha \cos \beta=(1 / 2)[\cos (\alpha-\beta)+\cos (\alpha+\beta)]$
$\sin \alpha \cos \beta=(1 / 2)[\sin (\alpha+\beta)+\sin (\alpha-\beta)]$
$\sin \alpha+\sin \beta=2 \sin (1 / 2)(\alpha+\beta) \cos (1 / 2)(\alpha-\beta)$
$\sin \alpha-\sin \beta=2 \cos (1 / 2)(\alpha+\beta) \sin (1 / 2)(\alpha-\beta)$
$\cos \alpha+\cos \beta=2 \cos (1 / 2)(\alpha+\beta) \cos (1 / 2)(\alpha-\beta)$
$\cos \alpha-\cos \beta=-2 \sin (1 / 2)(\alpha+\beta) \sin (1 / 2)(\alpha-\beta)$

## COMPLEX NUMBERS

Definition $i=\sqrt{-1}$
$(a+i b)+(c+i d)=(a+c)+i(b+d)$
$(a+i b)-(c+i d)=(a-c)+i(b-d)$
$(a+i b)(c+i d)=(a c-b d)+i(a d+b c)$
$\frac{a+i b}{c+i d}=\frac{(a+i b)(c-i d)}{(c+i d)(c-i d)}=\frac{(a c+b d)+i(b c-a d)}{c^{2}+d^{2}}$
$(a+i b)+(a-i b)=2 a$
$(a+i b)-(a-i b)=2 i b$
$(a+i b)(a-i b)=a^{2}+b^{2}$

## Polar Coordinates

$$
\begin{aligned}
& x=r \cos \theta ; y=r \sin \theta ; \theta=\arctan (y / x) \\
& r=|x+i y|=\sqrt{x^{2}+y^{2}} \\
& x+i y=r(\cos \theta+i \sin \theta)=r e^{i \theta} \\
& {\left[r_{1}\left(\cos \theta_{1}+i \sin \theta_{1}\right)\right]\left[r_{2}\left(\cos \theta_{2}+i \sin \theta_{2}\right)\right]=} \\
& \quad r_{1} r_{2}\left[\cos \left(\theta_{1}+\theta_{2}\right)+i \sin \left(\theta_{1}+\theta_{2}\right)\right] \\
& (x+i y)^{n} \quad=[r(\cos \theta+i \sin \theta)]^{n} \\
& \quad=r^{n}(\cos n \theta+i \sin n \theta) \\
& \frac{r_{1}\left(\cos \theta+i \sin \theta_{1}\right)}{r_{2}\left(\cos \theta_{2}+i \sin \theta_{2}\right)}=\frac{r_{1}}{r_{2}}\left[\cos \left(\theta_{1}-\theta_{2}\right)+i \sin \left(\theta_{1}-\theta_{2}\right)\right]
\end{aligned}
$$

## Euler's Identity

$e^{i \theta}=\cos \theta+i \sin \theta$
$e^{-i \theta}=\cos \theta-i \sin \theta$
$\cos \theta=\frac{e^{i \theta}+e^{-i \theta}}{2}, \quad \sin \theta=\frac{e^{i \theta}-e^{-i \theta}}{2 i}$

## Roots

If $k$ is any positive integer, any complex number (other than zero) has $k$ distinct roots. The $k$ roots of $r(\cos \theta+i \sin \theta)$ can be found by substituting successively $n=0,1,2, \ldots$,
( $k-1$ ) in the formula
$w=\sqrt[k]{r}\left[\cos \left(\frac{\theta}{k}+n \frac{360^{\circ}}{k}\right)+i \sin \left(\frac{\theta}{k}+n \frac{360^{\circ}}{k}\right)\right]$

## MATRICES

A matrix is an ordered rectangular array of numbers with $m$ rows and $n$ columns. The element $a_{i j}$ refers to row $i$ and column $j$.

## Multiplication

If $\boldsymbol{A}=\left(a_{i k}\right)$ is an $m \times n$ matrix and $\boldsymbol{B}=\left(b_{k j}\right)$ is an $n \times s$ matrix, the matrix product $A B$ is an $m \times s$ matrix

$$
\boldsymbol{C}=\left(c_{i j}\right)=\left(\sum_{l=1}^{n} a_{i l} b_{l j}\right)
$$

where $n$ is the common integer representing the number of columns of $\boldsymbol{A}$ and the number of rows of $\boldsymbol{B}(l$ and $k=1,2$, ..., $n$ ).

## Addition

If $\boldsymbol{A}=\left(a_{i j}\right)$ and $\boldsymbol{B}=\left(b_{i j}\right)$ are two matrices of the same size $m \times n$, the $\operatorname{sum} \boldsymbol{A}+\boldsymbol{B}$ is the $m \times n$ matrix $\boldsymbol{C}=\left(c_{i j}\right)$ where $c_{i j}=a_{i j}+b_{i j}$.

## Identity

The matrix $\mathbf{I}=\left(a_{i j}\right)$ is a square $n \times n$ identity matrix where $a_{i i}=1$ for $i=1,2, \ldots, n$ and $a_{i j}=0$ for $i \neq j$.

## Transpose

The matrix $\boldsymbol{B}$ is the transpose of the matrix $\boldsymbol{A}$ if each entry $b_{j i}$ in $\boldsymbol{B}$ is the same as the entry $a_{i j}$ in $\boldsymbol{A}$ and conversely. In equation form, the transpose is $\boldsymbol{B}=\boldsymbol{A}^{T}$.

## Inverse

The inverse $\boldsymbol{B}$ of a square $n \times n$ matrix $\boldsymbol{A}$ is
$\boldsymbol{B}=\boldsymbol{A}^{-1}=\frac{\operatorname{adj}(\boldsymbol{A})}{|\boldsymbol{A}|}$, where
$\operatorname{adj}(\boldsymbol{A})=$ adjoint of $\boldsymbol{A}$ (obtained by replacing $\boldsymbol{A}^{T}$ elements with their cofactors, see DETERMINANTS) and
$|\boldsymbol{A}|=$ determinant of $\boldsymbol{A}$.

## DETERMINANTS

A determinant of order $n$ consists of $n^{2}$ numbers, called the elements of the determinant, arranged in $n$ rows and $n$ columns and enclosed by two vertical lines. In any determinant, the minor of a given element is the determinant that remains after all of the elements are struck out that lie in the same row and in the same column as the given element. Consider an element which lies in the $h$ th column and the $k$ th row. The cofactor of this element is the value of the minor of the element (if $h+k$ is even), and it is the negative of the value of the minor of the element (if $h+$ $k$ is $o d d$ ).
If $n$ is greater than 1 , the value of a determinant of order $n$ is the sum of the $n$ products formed by multiplying each element of some specified row (or column) by its cofactor. This sum is called the expansion of the determinant [according to the elements of the specified row (or column)]. For a second-order determinant:
$\left|\begin{array}{ll}a_{1} & a_{2} \\ b_{1} & b_{2}\end{array}\right|=a_{1} b_{2}-a_{2} b_{1}$

For a third-order determinant:

$$
\left|\begin{array}{lll}
a_{1} & a_{2} & a_{3} \\
b_{1} & b_{2} & b_{3} \\
c_{1} & c_{2} & c_{3}
\end{array}\right|=a_{1} b_{2} c_{3}+a_{2} b_{3} c_{1}+a_{3} b_{1} c_{2}-a_{3} b_{2} c_{1}-a_{2} b_{1} c_{3}-a_{1} b_{3} c_{2}
$$

## VECTORS

Addition and subtraction:

$$
\begin{aligned}
& \mathbf{A}+\mathbf{B}=\left(a_{x}+b_{x}\right) \mathbf{i}+\left(a_{y}+b_{y}\right) \mathbf{j}+\left(a_{z}+b_{z}\right) \mathbf{k} \\
& \mathbf{A}-\mathbf{B}=\left(a_{x}-b_{x}\right) \mathbf{i}+\left(a_{y}-b_{y}\right) \mathbf{j}+\left(a_{z}-b_{z}\right) \mathbf{k}
\end{aligned}
$$

The dot product is a scalar product and represents the projection of $\mathbf{B}$ onto $\mathbf{A}$ times $|\mathbf{A}|$. It is given by

$$
\begin{aligned}
\mathbf{A} \cdot \mathbf{B} & =a_{x} b_{x}+a_{y} b_{y}+a_{z} b_{z} \\
& =|\mathbf{A}||\mathbf{B}| \cos \theta=\mathbf{B} \cdot \mathbf{A}
\end{aligned}
$$

The cross product is a vector product of magnitude $|\mathbf{B}||\mathbf{A}| \sin \theta$ which is perpendicular to the plane containing $\mathbf{A}$ and $\mathbf{B}$. The product is

$$
\mathbf{A} \times \mathbf{B}=\left|\begin{array}{ccc}
\mathbf{i} & \mathbf{j} & \mathbf{k} \\
a_{x} & a_{y} & a_{z} \\
b_{x} & b_{y} & b_{z}
\end{array}\right|=-\mathbf{B} \times \mathbf{A}
$$

The sense of $\mathbf{A} \times \mathbf{B}$ is determined by the right-hand rule.

$$
\mathbf{A} \times \mathbf{B}=|\mathbf{A}||\mathbf{B}| \mathbf{n} \sin \theta, \text { where }
$$

$\mathbf{n}=$ unit vector perpendicular to the plane of $\mathbf{A}$ and $\mathbf{B}$.

## Gradient, Divergence, and Curl

$\nabla \phi=\left(\frac{\partial}{\partial x} \mathbf{i}+\frac{\partial}{\partial y} \mathbf{j}+\frac{\partial}{\partial z} \mathbf{k}\right) \phi$
$\boldsymbol{\nabla} \cdot \mathbf{V}=\left(\frac{\partial}{\partial x} \mathbf{i}+\frac{\partial}{\partial y} \mathbf{j}+\frac{\partial}{\partial z} \mathbf{k}\right) \cdot\left(V_{1} \mathbf{i}+V_{2} \mathbf{j}+V_{3} \mathbf{k}\right)$
$\nabla \times \mathbf{V}=\left(\frac{\partial}{\partial x} \mathbf{i}+\frac{\partial}{\partial y} \mathbf{j}+\frac{\partial}{\partial z} \mathbf{k}\right) \times\left(V_{1} \mathbf{i}+V_{2} \mathbf{j}+V_{3} \mathbf{k}\right)$
The Laplacian of a scalar function $\phi$ is

$$
\nabla^{2} \phi=\frac{\partial^{2} \phi}{\partial x^{2}}+\frac{\partial^{2} \phi}{\partial y^{2}}+\frac{\partial^{2} \phi}{\partial z^{2}}
$$

## Identities

$\mathbf{A} \cdot \mathbf{B}=\mathbf{B} \cdot \mathbf{A} ; \mathbf{A} \cdot(\mathbf{B}+\mathbf{C})=\mathbf{A} \cdot \mathbf{B}+\mathbf{A} \cdot \mathbf{C}$
$\mathbf{A} \cdot \mathbf{A}=|\mathbf{A}|^{2}$
$\mathbf{i} \cdot \mathbf{i}=\mathbf{j} \cdot \mathbf{j}=\mathbf{k} \cdot \mathbf{k}=1$
$\mathbf{i} \cdot \mathbf{j}=\mathbf{j} \cdot \mathbf{k}=\mathbf{k} \cdot \mathbf{i}=0$
If $\mathbf{A} \cdot \mathbf{B}=0$, then either $\mathbf{A}=0, \mathbf{B}=0$, or $\mathbf{A}$ is perpendicular to $\mathbf{B}$.
$\mathbf{A} \times \mathbf{B}=-\mathbf{B} \times \mathbf{A}$
$\mathbf{A} \times(\mathbf{B}+\mathbf{C})=(\mathbf{A} \times \mathbf{B})+(\mathbf{A} \times \mathbf{C})$
$(\mathbf{B}+\mathbf{C}) \times \mathbf{A}=(\mathbf{B} \times \mathbf{A})+(\mathbf{C} \times \mathbf{A})$
$\mathbf{i} \times \mathbf{i}=\mathbf{j} \times \mathbf{j}=\mathbf{k} \times \mathbf{k}=0$
$\mathbf{i} \times \mathbf{j}=\mathbf{k}=-\mathbf{j} \times \mathbf{i} ; \mathbf{j} \times \mathbf{k}=\mathbf{i}=-\mathbf{k} \times \mathbf{j}$
$\mathbf{k} \times \mathbf{i}=\mathbf{j}=-\mathbf{i} \times \mathbf{k}$
If $\mathbf{A} \times \mathbf{B}=0$, then either $\mathbf{A}=0, \mathbf{B}=0$, or $\mathbf{A}$ is parallel to $\mathbf{B}$.

$$
\begin{aligned}
& \nabla^{2} \phi=\boldsymbol{\nabla} \cdot(\boldsymbol{\nabla} \phi)=(\boldsymbol{\nabla} \cdot \boldsymbol{\nabla}) \phi \\
& \boldsymbol{\nabla} \times \boldsymbol{\nabla} \phi=0 \\
& \boldsymbol{\nabla} \cdot(\boldsymbol{\nabla} \times \boldsymbol{A})=0 \\
& \boldsymbol{\nabla} \times(\boldsymbol{\nabla} \times \boldsymbol{A})=\boldsymbol{\nabla}(\boldsymbol{\nabla} \cdot \boldsymbol{A})-\boldsymbol{\nabla}^{2} \boldsymbol{A}
\end{aligned}
$$

## PROGRESSIONS AND SERIES

## Arithmetic Progression

To determine whether a given finite sequence of numbers is an arithmetic progression, subtract each number from the following number. If the differences are equal, the series is arithmetic.

1. The first term is $a$.
2. The common difference is $d$.
3. The number of terms is $n$.
4. The last or $n$th term is $l$.
5. The sum of $n$ terms is $S$.

$$
\begin{aligned}
l & =a+(n-1) d \\
S & =n(a+l) / 2=n[2 a+(n-1) d] / 2
\end{aligned}
$$

## Geometric Progression

To determine whether a given finite sequence is a geometric progression (G.P.), divide each number after the first by the preceding number. If the quotients are equal, the series is geometric.

1. The first term is $a$.
2. The common ratio is $r$.
3. The number of terms is $n$.
4. The last or $n$th term is $l$.
5. The sum of $n$ terms is $S$.

$$
\begin{aligned}
l & =a r^{n-1} \\
S & =a\left(1-r^{n}\right) /(1-r) ; r \neq 1 \\
S & =(a-r l) /(1-r) ; r \neq 1 \\
\operatorname{limit}_{n \rightarrow \infty} S_{n} & =a /(1-r) ; \quad r<1
\end{aligned}
$$

A G.P. converges if $|r|<1$ and it diverges if $|r| \geq 1$.

## Properties of Series

$$
\begin{aligned}
& \sum_{i=1}^{n} c=n c ; \quad c=\mathrm{constant} \\
& \sum_{i=1}^{n} c x_{i}=c \sum_{i=1}^{n} x_{i} \\
& \sum_{i=1}^{n}\left(x_{i}+y_{i}-z_{i}\right)=\sum_{i=1}^{n} x_{i}+\sum_{i=1}^{n} y_{i}-\sum_{i=1}^{n} z_{i} \\
& \sum_{x=1}^{n} x=\left(n+n^{2}\right) / 2
\end{aligned}
$$

1. A power series in $x$, or in $x-a$, which is convergent in the interval $-1<x<1$ (or $-1<x-a<1$ ), defines a function of $x$ which is continuous for all values of $x$ within the interval and is said to represent the function in that interval.
2. A power series may be differentiated term by term, and the resulting series has the same interval of convergence as the original series (except possibly at the end points of the interval).
3. A power series may be integrated term by term provided the limits of integration are within the interval of convergence of the series.
4. Two power series may be added, subtracted, or multiplied, and the resulting series in each case is convergent, at least, in the interval common to the two series.
5. Using the process of long division (as for polynomials), two power series may be divided one by the other.

## Taylor's Series

$$
\begin{array}{r}
f(x)=f(a)+\frac{f^{\prime}(a)}{1!}(x-a)+\frac{f^{\prime \prime}(a)}{2!}(x-a)^{2} \\
+\ldots+\frac{f^{(n)}(a)}{n!}(x-a)^{n}+\ldots
\end{array}
$$

is called Taylor's series, and the function $f(x)$ is said to be expanded about the point $a$ in a Taylor's series.
If $a=0$, the Taylor's series equation becomes a Maclaurin's series.

## PROBABILITY AND STATISTICS

## Permutations and Combinations

A permutation is a particular sequence of a given set of objects. A combination is the set itself without reference to order.

1. The number of different permutations of $n$ distinct objects taken $r$ at a time is

$$
P(n, r)=\frac{n!}{(n-r)!}
$$

2. The number of different combinations of $n$ distinct objects taken $r$ at a time is

$$
C(n, r)=\frac{P(n, r)}{r!}=\frac{n!}{[r!(n-r)!]}
$$

3. The number of different permutations of $n$ objects taken $n$ at a time, given that $n_{i}$ are of type $i$, where $i=1,2, \ldots, k$ and $\Sigma n_{i}=n$, is

$$
P\left(n ; n_{1}, n_{2}, \ldots n_{k}\right)=\frac{n!}{n_{1}!n_{2}!\ldots n_{k}!}
$$

## Laws of Probability

## Property 1. General Character of Probability

The probability $P(E)$ of an event $E$ is a real number in the range of 0 to 1 . The probability of an impossible event is 0 and that of an event certain to occur is 1 .

## Property 2. Law of Total Probability

$$
P(A+B)=P(A)+P(B)-P(A, B), \text { where }
$$

$P(A+B)=$ the probability that either $A$ or $B$ occur alone or that both occur together,
$P(A)=$ the probability that $A$ occurs,
$P(B) \quad=\quad$ the probability that $B$ occurs, and
$P(A, B)=$ the probability that both $A$ and $B$ occur simultaneously.

Property 3. Law of Compound or Joint Probability If neither $P(A)$ nor $P(B)$ is zero,

$$
P(A, B)=P(A) P(B \mid A)=P(B) P(A \mid B), \text { where }
$$

$P(B \mid A)=$ the probability that $B$ occurs given the fact that $A$ has occurred, and
$P(A \mid B)=$ the probability that $A$ occurs given the fact that $B$ has occurred.
If either $P(A)$ or $P(B)$ is zero, then $P(A, B)=0$.

## Probability Functions

A random variable $x$ has a probability associated with each of its values. The probability is termed a discrete probability if $x$ can assume only the discrete values

$$
x=X_{1}, X_{2}, \ldots, X_{i}, \ldots, X_{N}
$$

The discrete probability of the event $X=x_{i}$ occurring is defined as $P\left(X_{i}\right)$.

## Probability Density Functions

If $x$ is continuous, then the probability density function $f(x)$ is defined so that

$$
\int_{x_{1}}^{x_{2}} f(x) d x=\text { the probability that } x \text { lies between } x_{1} \text { and } x_{2}
$$

The probability is determined by defining the equation for $f(x)$ and integrating between the values of $x$ required.

## Probability Distribution Functions

The probability distribution function $F\left(X_{n}\right)$ of the discrete probability function $P\left(X_{i}\right)$ is defined by

$$
F\left(X_{n}\right)=\sum_{k=1}^{n} P\left(X_{k}\right)=P\left(X_{i} \leq X_{n}\right)
$$

When $x$ is continuous, the probability distribution function $F(x)$ is defined by

$$
F(x)=\int_{-\infty}^{x} f(t) d t
$$

which implies that $F(a)$ is the probability that $x \leq a$.
The expected value $g(x)$ of any function is defined as

$$
E\{g(x)\}=\int_{-\infty}^{x} g(t) f(t) d t
$$

## Binomial Distribution

$P(x)$ is the probability that $x$ will occur in $n$ trials. If $p=$ probability of success and $q=$ probability of failure $=1-p$, then

$$
\begin{array}{ll} 
& P(x)=C(n, x) p^{x} q^{n-x}=\frac{n!}{x!(n-x)!} p^{x} q^{n-x}, \text { where } \\
x & =0,1,2, \ldots, n \\
C(n, x)= & \text { the number of combinations, and } \\
n, p \quad= & \text { parameters. }
\end{array}
$$

## Normal Distribution (Gaussian Distribution)

This is a unimodal distribution, the mode being $x=\mu$, with two points of inflection (each located at a distance $\sigma$ to either side of the mode). The averages of $n$ observations tend to become normally distributed as $n$ increases. The variate $x$ is said to be normally distributed if its density function $f(x)$ is given by an expression of the form

$$
f(x)=\frac{1}{\sigma \sqrt{2 \pi}} e^{-(x-\mu)^{2} / 2 \sigma^{2}}, \text { where }
$$

$\mu=$ the population mean,
$\sigma=$ the standard deviation of the population, and

$$
-\infty \leq x \leq \infty
$$

When $\mu=0$ and $\sigma^{2}=\sigma=1$, the distribution is called a standardized or unit normal distribution. Then

$$
f(x)=\frac{1}{\sqrt{2 \pi}} e^{-x^{2} / 2}, \quad \text { where }-\infty \leq x \leq \infty .
$$

A unit normal distribution table is included at the end of this section. In the table, the following notations are utilized:
$F(x)=$ the area under the curve from $-\infty$ to $x$,
$R(x)=$ the area under the curve from $x$ to $\infty$, and
$W(x)=$ the area under the curve between $-x$ and $x$.
Dispersion, Mean, Median, and Mode Values
If $X_{1}, X_{2}, \ldots, X_{n}$ represent the values of $n$ items or observations, the arithmetic mean of these items or observations, denoted $\bar{X}$, is defined as

$$
\begin{aligned}
& \bar{X}=(1 / n)\left(X_{1}+X_{2}+\ldots+X_{n}\right)=(1 / n) \sum_{i=1}^{n} X_{i} \\
& \bar{X} \rightarrow \mu \text { for sufficiently large values of } n .
\end{aligned}
$$

The weighted arithmetic mean is

$$
\bar{X}_{w}=\frac{\sum w_{i} X_{i}}{\sum w_{i}}, \text { where }
$$

$\bar{X}_{w}=$ the weighted arithmetic mean,
$X_{i}=$ the values of the observations to be averaged, and
$w_{i}=$ the weight applied to the $X_{i}$ value.
The variance of the observations is the arithmetic mean of the squared deviations from the population mean. In symbols, $X_{1}, X_{2}, \ldots, X_{n}$ represent the values of the $n$ sample observations of a population of size $N$. If $\mu$ is the arithmetic mean of the population, the population variance is defined by

$$
\begin{aligned}
\sigma^{2} & =(1 / N)\left[\left(X_{1}-\mu\right)^{2}+\left(X_{2}-\mu\right)^{2}+\ldots+\left(X_{N}-\mu\right)^{2}\right] \\
& =(1 / N) \sum_{i=1}^{N}\left(X_{i}-\mu\right)^{2}
\end{aligned}
$$

The standard deviation of a population is

$$
\sigma=\sqrt{(1 / N) \sum\left(X_{i}-\mu\right)^{2}}
$$

The sample variance is

$$
s^{2}=[1 /(n-1)] \sum_{i=1}^{n}\left(X_{i}-\bar{X}\right)^{2}
$$

The sample standard deviation is

$$
s=\sqrt{\left[\frac{1}{n-1}\right] \sum_{i=1}^{n}\left(X_{i}-\bar{X}\right)^{2}}
$$

The coefficient of variation $=C V=s / \bar{X}$
The geometric mean $=\sqrt[n]{X_{1} X_{2} X_{3} \ldots X_{n}}$
The root-mean-square value $=\sqrt{(1 / n) \sum X_{i}^{2}}$
The median is defined as the value of the middle item when the data are rank-ordered and the number of items is odd. The median is the average of the middle two items when the rank-ordered data consists of an even number of items.
The mode of a set of data is the value that occurs with greatest frequency.

## t-Distribution

The variate $t$ is defined as the quotient of two independent variates $x$ and $r$ where $x$ is unit normal and $r$ is the root mean square of $n$ other independent unit normal variates; that is, $t=x / r$. The following is the $t$-distribution with $n$ degrees of freedom:

$$
f(t)=\frac{\Gamma[(n+1)] / 2}{\Gamma(n / 2) \sqrt{n \pi}} \frac{1}{\left(1+t^{2} / n\right)^{(n+1) / 2}}
$$

where $-\infty \leq t \leq \infty$.
A table at the end of this section gives the values of $t_{\alpha, n}$ for values of $\alpha$ and $n$. Note that in view of the symmetry of the $t$-distribution,
$t_{1-\alpha, n}=-t_{\alpha, n}$. The function for $\alpha$ follows:

$$
\alpha=\int_{t_{\alpha, n}}^{\infty} f(t) d t
$$

A table showing probability and density functions is included on page 149 in the INDUSTRIAL ENGINEERING SECTION of this handbook.

## GAMMA FUNCTION

$$
\Gamma(n)=\int_{o}^{\infty} t^{n-1} e^{-t} d t, \quad n>0
$$

## CONFIDENCE INTERVALS

Confidence Interval for the Mean $\mu$ of a Normal Distribution
(a) Standard deviation $\sigma$ is known

$$
\bar{X}-Z_{\alpha / 2} \frac{\sigma}{\sqrt{n}} \leq \mu \leq \bar{X}+Z_{\alpha / 2} \frac{\sigma}{\sqrt{n}}
$$

(b) Standard deviation $\sigma$ is not known

$$
\bar{X}-t_{\alpha / 2} \frac{s}{\sqrt{n}} \leq \mu \leq \bar{X}+t_{\alpha / 2} \frac{s}{\sqrt{n}}
$$

where $t_{\alpha / 2}$ corresponds to $\mathrm{n}-1$ degrees of freedom.
Confidence Interval for the Difference Between Two
Means $\mu_{1}$ and $\mu_{2}$
(a) Standard deviations $\sigma_{1}$ and $\sigma_{2}$ known

$$
\bar{X}_{1}-\bar{X}_{2}-Z_{\alpha / 2} \sqrt{\frac{\sigma_{1}^{2}}{n_{1}}+\frac{\sigma_{2}^{2}}{n_{2}}} \leq \mu_{1}-\mu_{2} \leq \bar{X}_{1}-\bar{X}_{2}+Z_{\alpha / 2} \sqrt{\frac{\sigma_{1}^{2}}{n_{1}}+\frac{\sigma_{2}^{2}}{n_{2}}}
$$

(b) Standard deviations $\sigma_{1}$ and $\sigma_{2}$ are not known

$$
\bar{X}_{1}-\bar{X}_{2}-t_{\alpha / 2} \sqrt{\frac{\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)\left[(n-1) S_{1}^{2}+\left(n_{2}-1\right) S_{2}^{2}\right]}{n_{1}+n_{2}-2}} \leq \mu_{1}-\mu_{2} \leq \bar{X}_{1}-\bar{X}_{2}-t_{\alpha / 2} \sqrt{\frac{\left(\frac{1}{n_{1}}+\frac{1}{n_{2}}\right)\left[(n-1) S_{1}^{2}+\left(n_{2}-1\right) S_{2}^{2}\right]}{n_{1}+n_{2}-2}}
$$

where $t_{\alpha / 2}$ corresponds to $n_{1}+n_{2}-2$ degrees of freedom.

## DIFFERENTIAL CALCULUS

## The Derivative

For any function $y=f(x)$,
the derivative $\quad=D_{x} y=d y / d x=y^{\prime}$

$$
\begin{aligned}
y^{\prime} & =\underset{\Delta x \rightarrow 0}{\operatorname{limit}}[(\Delta y) /(\Delta x)] \\
& =\underset{\Delta x \rightarrow 0}{\operatorname{limit}}\{[f(x+\Delta x)-f(x)] /(\Delta x)\} \\
y^{\prime} & =\text { the slope of the curve } f(x) .
\end{aligned}
$$

## Test for a Maximum

$$
\begin{aligned}
& y=f(x) \text { is a maximum for } \\
& x=a, \text { if } f^{\prime}(a)=0 \text { and } f^{\prime \prime}(a)<0 .
\end{aligned}
$$

## Test for a Minimum

$$
\begin{aligned}
& y=f(x) \text { is a minimum for } \\
& x=a, \text { if } f^{\prime}(a)=0 \text { and } f^{\prime \prime}(a)>0 .
\end{aligned}
$$

Test for a Point of Inflection

$$
y=f(x) \text { has a point of inflection at } x=a \text {, }
$$

if $\quad f^{\prime \prime}(a)=0$, and
if $\quad f^{\prime \prime}(x)$ changes sign as $x$ increases through

$$
x=a .
$$

## The Partial Derivative

In a function of two independent variables $x$ and $y$, a derivative with respect to one of the variables may be found if the other variable is assumed to remain constant. If $y$ is kept fixed, the function

$$
z=f(x, y)
$$

becomes a function of the single variable $x$, and its derivative (if it exists) can be found. This derivative is called the partial derivative of $z$ with respect to $x$. The partial derivative with respect to $x$ is denoted as follows:

$$
\frac{\partial z}{\partial x}=\frac{\partial f(x, y)}{\partial x}
$$

## The Curvature of Any Curve

The curvature $K$ of a curve at $P$ is the limit of its average curvature for the arc $P Q$ as $Q$ approaches $P$. This is also expressed as: the curvature of a curve at a given point is the rate-of-change of its inclination with respect to its arc length.
$K=\operatorname{limitit}_{\Delta s \rightarrow 0} \frac{\Delta \alpha}{\Delta s}=\frac{d \alpha}{d s}$

## Curvature in Rectangular Coordinates

$$
K=\frac{y^{\prime \prime}}{\left[1+\left(y^{\prime}\right)^{2}\right]^{3 / 2}}
$$

When it may be easier to differentiate the function with respect to $y$ rather than $x$, the notation $x^{\prime}$ will be used for the derivative.

$$
x^{\prime}=d x / d y
$$

$$
K=\frac{-x^{\prime \prime}}{\left[1+\left(x^{\prime}\right)^{2}\right]^{3 / 2}}
$$

## The Radius of Curvature

The radius of curvature $R$ at any point on a curve is defined as the absolute value of the reciprocal of the curvature $K$ at that point.

$$
R=\frac{1}{|K|} \quad(K \neq 0)
$$

$$
R=\left|\frac{\left[1+\left(y^{\prime}\right)^{2}\right]^{3 / 2}}{\left|y^{\prime \prime}\right|}\right| \quad\left(y^{\prime \prime} \neq 0\right)
$$

## L'Hospital's Rule (L'Hôpital's Rule)

If the fractional function $f(x) g(x)$ assumes one of the indeterminate forms $0 / 0$ or $\infty / \infty$ (where $\alpha$ is finite or infinite), then

$$
\operatorname{limit}_{x \rightarrow \alpha} f(x) / g(x)
$$

is equal to the first of the expressions

$$
\operatorname{liminit}_{x \rightarrow \alpha} \frac{f^{\prime}(x)}{g^{\prime}(x)}, \operatorname{liminit}_{x \rightarrow \alpha} \frac{f^{\prime \prime}(x)}{g^{\prime \prime}(x)}, \operatorname{limit}_{x \rightarrow \alpha} \frac{f^{\prime \prime \prime}(x)}{g^{\prime \prime \prime}(x)}
$$

which is not indeterminate, provided such first indicated limit exists.

## INTEGRAL CALCULUS

The definite integral is defined as:

$$
\operatorname{limit}_{n \rightarrow \infty} \sum_{i=1}^{n} f\left(x_{i}\right) \Delta x_{i}=\int_{a}^{b} f(x) d x
$$

Also, $\Delta x_{i} \rightarrow 0$ for all $i$.
A table of derivatives and integrals is available on page 15. The integral equations can be used along with the following methods of integration:
A. Integration by Parts (integral equation \#6),
B. Integration by Substitution, and
C. Separation of Rational Fractions into Partial Fractions.

[^0]
## DERIVATIVES AND INDEFINITE INTEGRALS

In these formulas, $u, v$, and $w$ represent functions of $x$. Also, $a, c$, and $n$ represent constants. All arguments of the trigonometric functions are in radians. A constant of integration should be added to the integrals. To avoid terminology difficulty, the following definitions are followed: $\arcsin u=\sin ^{-1} u,(\sin u)^{-1}=1 / \sin u$.

1. $d c / d x=0$
2. $d x / d x=1$
3. $d(c u) / d x=c d u / d x$
4. $d(u+v-w) / d x=d u / d x+d v / d x-d w / d x$
5. $\quad d(u v) / d x=u d v / d x+v d u / d x$
6. $\quad d(u v w) / d x=u v d w / d x+u w d v / d x+v w d u / d x$
7. $\frac{d(u / v)}{d x}=\frac{v d u / d x-u d v / d x}{v^{2}}$
8. $d\left(u^{n}\right) / d x=n u^{n-1} d u / d x$
9. $d[f(u)] / d x=\{d[f(u)] / d u\} d u / d x$
10. $d u / d x=1 /(d x / d u)$
11. $\frac{d\left(\log _{a} u\right)}{d x}=\left(\log _{\mathrm{a}} e\right) \frac{1}{u} \frac{d u}{d x}$
12. $\frac{d(\ln u)}{d x}=\frac{1}{u} \frac{d u}{d x}$
13. $\frac{d\left(a^{u}\right)}{d x}=(\ln a) a^{u} \frac{d u}{d x}$
14. $d\left(e^{u}\right) / d x=e^{u} d u / d x$
15. $d\left(u^{v}\right) / d x=v u^{v-1} d u / d x+(\ln u) u^{v} d v / d x$
16. $d(\sin u) / d x=\cos u d u / d x$
17. $d(\cos u) / d x=-\sin u d u / d x$
18. $d(\tan u) / d x=\sec ^{2} u d u / d x$
19. $d(\cot u) / d x=-\csc ^{2} u d u / d x$
20. $d(\sec u) / d x=\sec u \tan u d u / d x$
21. $d(\csc u) / d x=-\csc u \cot u d u / d x$
22. $\frac{d\left(\sin ^{-1} u\right)}{d x}=\frac{1}{\sqrt{1-u^{2}}} \frac{d u}{d x} \quad\left(-\pi / 2 \leq \sin ^{-1} u \leq \pi / 2\right)$
23. $\frac{d\left(\cos ^{-1} u\right)}{d x}=-\frac{1}{\sqrt{1-u^{2}}} \frac{d u}{d x} \quad\left(0 \leq \cos ^{-1} u \leq \pi\right)$
24. $\frac{d\left(\tan ^{-1} u\right)}{d x}=\frac{1}{1+u^{2}} \frac{d u}{d x} \quad\left(-\pi / 2<\tan ^{-1} u<\pi / 2\right)$
25. $\frac{d\left(\cot ^{-1} u\right)}{d x}=-\frac{1}{1+u^{2}} \frac{d u}{d x} \quad\left(0<\cot ^{-1} u<\pi\right)$
26. $\frac{d\left(\sec ^{-1} u\right)}{d x}=\frac{1}{u \sqrt{u^{2}-1}} \frac{d u}{d x}$
$\left(0 \leq \sec ^{-1} u<\pi / 2\right)\left(-\pi \leq \sec ^{-1} u<-\pi / 2\right)$
27. $\frac{d\left(\csc ^{-1} u\right)}{d x}=-\frac{1}{u \sqrt{u^{2}-1}} \frac{d u}{d x}$

$$
\left(0<\csc ^{-1} u \leq \pi / 2\right)\left(-\pi<\csc ^{-1} u \leq-\pi / 2\right)
$$

1. $\int d f(x)=f(x)$
2. $\int d x=x$
3. $\int a f(x) d x=a \int f(x) d x$
4. $\int[u(x) \pm v(x)] d x=\int u(x) d x \pm \int v(x) d x$
5. $\int x^{m} d x=\frac{x^{m+1}}{m+1} \quad(m \neq-1)$
6. $\int u(x) d v(x)=u(x) v(x)-\int v(x) d u(x)$
7. $\int \frac{d x}{a x+b}=\frac{1}{a} \ln |a x+b|$
8. $\int \frac{d x}{\sqrt{x}}=2 \sqrt{x}$
9. $\int a^{x} d x=\frac{a^{x}}{\ln a}$
10. $\int \sin x d x=-\cos x$
11. $\int \cos x d x=\sin x$
12. $\int \sin ^{2} x d x=\frac{x}{2}-\frac{\sin 2 x}{4}$
13. $\int \cos ^{2} x d x=\frac{x}{2}+\frac{\sin 2 x}{4}$
14. $\int x \sin x d x=\sin x-x \cos x$
15. $\int x \cos x d x=\cos x+x \sin x$
16. $\int \sin x \cos x d x=\left(\sin ^{2} x\right) / 2$
17. $\int \sin a x \cos b x d x=-\frac{\cos (a-b) x}{2(a-b)}-\frac{\cos (a+b) x}{2(a+b)} \quad\left(a^{2} \neq b^{2}\right)$
18. $\int \tan x d x=-\ln |\cos x|=\ln |\sec x|$
19. $\int \cot x d x=-\ln |\csc x|=\ln |\sin x|$
20. $\int \tan ^{2} x d x=\tan x-x$
21. $\int \cot ^{2} x d x=-\cot x-x$
22. $\int e^{a x} d x=(1 / a) e^{a x}$
23. $\int x e^{a x} d x=\left(e^{a x} / a^{2}\right)(a x-1)$
24. $\int \ln x d x=x[\ln (x)-1]$
25. $\int \frac{d x}{a^{2}+x^{2}}=\frac{1}{a} \tan ^{-1} \frac{x}{a}$
26. $\int \frac{d x}{a x^{2}+c}=\frac{1}{\sqrt{a} c} \tan ^{-1}\left(x \sqrt{\frac{a}{c}}\right), \quad(a>0, c>0)$

27a. $\int \frac{d x}{a x^{2}+b x+c}=\frac{2}{\sqrt{4 a c-b^{2}}} \tan ^{-1} \frac{2 a x+b}{\sqrt{4 a c-b^{2}}}$

$$
\left(4 a c-b^{2}>0\right)
$$

27b. $\int \frac{d x}{a x^{2}+b x+c}=\frac{1}{\sqrt{b^{2}-4 a c}} \ln \left|\frac{2 a x+b-\sqrt{b^{2}-4 a c}}{2 a x+b+\sqrt{b^{2}-4 a c}}\right|$

$$
\left(b^{2}-4 a c>0\right)
$$

27c. $\int \frac{d x}{a x^{2}+b x+c}=-\frac{2}{2 a x+b}, \quad\left(b^{2}-4 a c=0\right)$

## MENSURATION OF AREAS AND VOLUMES

## Nomenclature

$A=$ total surface area
$P=$ perimeter
$V=$ volume

## Parabola

$A=2 b h / 3$

## Ellipse

- 

$P_{\text {approx }}=2 \pi \sqrt{\left(a^{2}+b^{2}\right) / 2}$
$P=\pi(a+b)\left[\begin{array}{l}1+(1 / 2)^{2} \lambda^{2}+(1 / 2 \times 1 / 4)^{2} \lambda^{4} \\ +(1 / 2 \times 1 / 4 \times 3 / 6)^{2} \lambda^{6}+(1 / 2 \times 1 / 4 \times 3 / 6 \times 5 / 8)^{2} \lambda^{8} \\ +(1 / 2 \times 1 / 4 \times 3 / 6 \times 5 / 8 \times 7 / 10)^{2} \lambda^{10}+\ldots\end{array}\right]$,
where
$\lambda=(a-b) /(a+b)$

## Circular Segment

- 

$$
\begin{aligned}
& A=\left[r^{2}(\phi-\sin \phi)\right] / 2 \\
& \phi=s / r=2\{\arccos [(r-d) / r]\}
\end{aligned}
$$

## Circular Sector

$$
\begin{aligned}
& A=\phi r^{2} / 2=s r / 2 \\
& \phi=s / r
\end{aligned}
$$

## Sphere

- 

$$
\begin{aligned}
& V=4 \pi r^{3} / 3=\pi d^{3} / 6 \\
& A=4 \pi r^{2}=\pi d^{2}
\end{aligned}
$$

## Parallelogram

If $a=b$, the parallelogram is a rhombus.
Regular Polygon ( $n$ equal sides)

$$
\begin{aligned}
& \phi=2 \pi / n \\
& \theta=\left[\frac{\pi(n-2)}{n}\right]=\pi\left(1-\frac{2}{n}\right)
\end{aligned}
$$

$$
P=n s
$$

$$
s=2 r[\tan (\phi / 2)]
$$

$$
A=(n s r) / 2
$$

## Prismoid

$$
V=(h / 6)\left(A_{1}+A_{2}+4 A\right)
$$

## Right Circular Cone

$$
\begin{aligned}
& V=\left(\pi r^{2} h\right) / 3 \\
& A=\text { side area }+ \text { base area } \\
& =\pi r\left(r+\sqrt{r^{2}+h^{2}}\right) \\
& A_{x}: A_{b}=x^{2}: h^{2}
\end{aligned}
$$

## Right Circular Cylinder

$$
\begin{aligned}
& V=\pi r^{2} h=\frac{\pi d^{2} h}{4} \\
& A=\text { side area }+ \text { end areas }=2 \pi r(h+r)
\end{aligned}
$$

## Paraboloid of Revolution

$$
V=\frac{\pi d^{2} h}{8}
$$

## CENTROIDS AND MOMENTS OF INERTIA

The location of the centroid of an area, bounded by the axes and the function $y=f(x)$, can be found by integration.

$$
\begin{aligned}
& x_{c}=\frac{\int x d A}{A} \\
& y_{c}=\frac{\int y d A}{A} \\
& A=\int f(x) d x \\
& d A=f(x) d x=g(y) d y
\end{aligned}
$$

The first moment of area with respect to the $y$-axis and the $x$-axis, respectively, are:

$$
\begin{aligned}
& M_{y}=\int x d A=x_{c} A \\
& M_{x}=\int y d A=y_{c} A
\end{aligned}
$$

when either $\overline{\mathrm{x}}$ or $\overline{\mathrm{y}}$ is of finite dimensions then $\int x d A$ or $\int y d A$ refer to the centroid $x$ or $y$ of $d A$ in these integrals. The moment of inertia (second moment of area) with respect to the $y$-axis and the $x$-axis, respectively, are:

$$
\begin{aligned}
I_{y} & =\int x^{2} d A \\
I_{x} & =\int y^{2} d A
\end{aligned}
$$

The moment of inertia taken with respect to an axis passing through the area's centroid is the centroidal moment of inertia. The parallel axis theorem for the moment of inertia with respect to another axis parallel with and located $d$ units from the centroidal axis is expressed by

$$
I_{\text {parallel axis }}=I_{c}+A d^{2}
$$

In a plane, $J=\int r^{2} d A=I_{x}+I_{y}$
Values for standard shapes are presented in a table in the DYNAMICS section.

## DIFFERENTIAL EQUATIONS

A common class of ordinary linear differential equations is

$$
b_{n} \frac{d^{n} y(x)}{d x^{n}}+\ldots+b_{1} \frac{d y(x)}{d x}+b_{0} y(x)=f(x)
$$

where $b_{n}, \ldots, b_{i}, \ldots, b_{1}, b_{0}$ are constants.
When the equation is a homogeneous differential equation, $f(x)=0$, the solution is

$$
y_{h}(x)=C_{1} e^{r_{i} x}+C_{2} e^{r_{2} x}+\ldots+C_{i} e^{r_{i} x}+\ldots+C_{n} e^{r_{n} x}
$$

where $r_{n}$ is the $n$th distinct root of the characteristic polynomial $P(x)$ with

$$
P(r)=b_{n} r^{n}+b_{n-1} r^{n-1}+\ldots+b_{1} r+b_{0}
$$

If the root $r_{1}=r_{2}$, then $C_{2} e^{r_{2} x}$ is replaced with $C_{2} x e^{r_{1} x}$.
Higher orders of multiplicity imply higher powers of $x$. The complete solution for the differential equation is

$$
y(x)=y_{h}(x)+y_{p}(x)
$$

where $y_{p}(x)$ is any solution with $f(x)$ present. If $f(x)$ has $e^{r_{n} x}$ terms, then resonance is manifested. Furthermore, specific $f(x)$ forms result in specific $y_{p}(x)$ forms, some of which are:

| $\boldsymbol{f}(\boldsymbol{x})$ | $\boldsymbol{y}_{p}{ }^{(x)}$ |
| :--- | :--- |
| $A$ | $B$ |
| $A e^{\alpha x}$ | $B e^{\alpha x}, \alpha \neq r_{n}$ |
| $A_{1} \sin \omega x+A_{2} \cos \omega x$ | $B_{1} \sin \omega x+B_{2} \cos \omega x$ |

If the independent variable is time $t$, then transient dynamic solutions are implied.

## First-Order Linear Homogeneous Differential Equations With Constant Coefficients

$$
y^{\prime}+a y=0, \text { where } a \text { is a real constant: }
$$

$$
\text { Solution, } y=C e^{-a t}
$$

where $C=$ a constant that satisfies the initial conditions.

## First-Order Linear Nonhomogeneous Differential Equations

$$
\begin{gathered}
\tau \frac{d y}{d t}+y=K x(t) \quad x(t)=\left\{\begin{array}{ll}
A & t<0 \\
B & t>0
\end{array}\right\} \\
y(0)=K A
\end{gathered}
$$

$\tau$ is the time constant
K is the gain
The solution is

$$
\begin{aligned}
& y(t)=K A+(K B-K A)\left(1-\exp \left(\frac{-t}{\tau}\right)\right) \text { or } \\
& \frac{t}{\tau}=\ln \left[\frac{K B-K A}{K B-y}\right]
\end{aligned}
$$

## Second-Order Linear Homogeneous Differential Equations with Constant Coefficients

An equation of the form

$$
y^{\prime \prime}+2 a y^{\prime}+b y=0
$$

can be solved by the method of undetermined coefficients where a solution of the form $y=C e^{r x}$ is sought. Substitution of this solution gives

$$
\left(r^{2}+2 a r+b\right) C e^{r x}=0
$$

and since $C e^{r x}$ cannot be zero, the characteristic equation must vanish or

$$
r^{2}+2 a r+b=0
$$

The roots of the characteristic equation are

$$
r_{1,2}=-a \pm \sqrt{a^{2}-b}
$$

and can be real and distinct for $a^{2}>b$, real and equal for $a^{2}=b$, and complex for $a^{2}<b$.
If $a^{2}>b$, the solution is of the form (overdamped)

$$
y=C_{1} e^{r_{1} x}+C_{2} e^{r_{2} x}
$$

If $a^{2}=b$, the solution is of the form (critically damped)

$$
y=\left(C_{1}+C_{2} x\right) e^{r_{1} x}
$$

If $a^{2}<b$, the solution is of the form (underdamped)

$$
\begin{aligned}
& y=e^{\alpha x}\left(C_{1} \cos \beta x+C_{2} \sin \beta x\right), \text { where } \\
& \alpha=-a \\
& \beta=\sqrt{b-a^{2}}
\end{aligned}
$$

## FOURIER SERIES

Every function $F(t)$ which has the period $\tau=2 \pi / \omega$ and satisfies certain continuity conditions can be represented by a series plus a constant.

$$
F(t)=a_{0} / 2+\sum_{n=1}^{\infty}\left[a_{n} \cos (n \omega t)+b_{n} \sin (n \omega t)\right]
$$

The above equation holds if $F(t)$ has a continuous derivative $F^{\prime}(t)$ for all $t$. Multiply both sides of the equation by $\cos$ $m \omega t$ and integrate from 0 to $\tau$.

$$
\begin{gathered}
\int_{0}^{\tau} F(t) \cos (m \omega t) d t=\int_{0}^{\tau}\left(a_{0} / 2\right) \cos (m \omega t) d t \\
\int_{0}^{\tau} F(t) \cos (m \omega t) d t=\int_{0}^{\tau}\left(a_{0} / 2\right) \cos (m \omega t) d t \\
+\sum_{n=1}^{\infty}\left[a_{n} \int_{0}^{\tau} \cos (m \omega t) \cos (m \omega t) d t\right. \\
\left.\quad+b_{n} \int_{0}^{\tau} \sin (m \omega t) \cos (m \omega t) d t\right]
\end{gathered}
$$

Term-by-term integration of the series can be justified if $F(t)$ is continuous. The coefficients are

$$
\begin{aligned}
& a_{n}=(2 / \tau) \int_{0}^{\tau} F(t) \cos (n \omega t) d t \text { and } \\
& b_{n}=(2 / \tau) \int_{0}^{\tau} F(t) \sin (n \omega t) d t, \text { where }
\end{aligned}
$$

$\tau=2 \pi / \omega$. The constants $a_{n}, b_{n}$ are the Fourier coefficients of $F(t)$ for the interval 0 to $\tau$, and the corresponding series is called the Fourier series of $F(t)$ over the same interval. The integrals have the same value over any interval of length $\tau$.

If a Fourier series representing a periodic function is truncated after term $n=N$, the mean square value $F_{N}{ }^{2}$ of the truncated series is given by the Parseval relation. This relation says that the mean square value is the sum of the mean square values of the Fourier components, or

$$
F_{N}^{2}=\left(a_{0} / 2\right)^{2}+(1 / 2) \sum_{n=1}^{N}\left(a_{n}^{2}+b_{n}^{2}\right)
$$

and the RMS value is then defined to be the square root of this quantity or $F_{N}$.

## FOURIER TRANSFORM

The Fourier transform pair, one form of which is

$$
\begin{aligned}
& F(\omega)=\int_{-\infty}^{\infty} f(t) e^{-j \omega t} d t \\
& f(t)=[1 /(2 \pi)] \int_{-\infty}^{\infty} F(\omega) e^{j \omega t} d \omega
\end{aligned}
$$

can be used to characterize a broad class of signal models in terms of their frequency or spectral content. Some useful transform pairs are:

| $\boldsymbol{f}(\boldsymbol{t})$ | $\boldsymbol{F}(\boldsymbol{\omega})$ |
| :--- | :--- |
| $\boldsymbol{\delta}(t)$ | 1 |
| $u(t)$ | $\pi \delta(\omega)+1 / \mathbf{j} \omega$ |
| $u\left(t+\frac{\tau}{2}\right)-u\left(t-\frac{\tau}{2}\right)=r_{\text {rect }} \frac{t}{\tau}$ | $\tau \frac{\sin (\omega \tau / 2)}{\omega \tau / 2}$ |
| $e^{j \omega_{o} t}$ | $2 \pi \delta\left(\omega-\omega_{o}\right)$ |

Some mathematical liberties are required to obtain the second and fourth form. Other Fourier transforms are derivable from the Laplace transform by replacing $s$ with $\mathrm{j} \omega$ provided

$$
\begin{aligned}
& f(t)=0, t<0 \\
& \int_{0}^{\infty}|f(t)| d t<\infty
\end{aligned}
$$

## LAPLACE TRANSFORMS

The unilateral Laplace transform pair

$$
\begin{aligned}
& F(s)=\int_{0}^{\infty} f(t) e^{-s t} d t \\
& f(t)=\frac{1}{2 \pi i} \int_{\sigma-i \infty}^{\sigma+i \infty} F(s) e^{s t} d t
\end{aligned}
$$

represents a powerful tool for the transient and frequency response of linear time invariant systems. Some useful Laplace transform pairs are [Note: The last two transforms represent the Final Value Theorem (F.V.T.) and Initial Value Theorem (I.V.T.) respectively. It is assumed that the limits exist.]:

| $\boldsymbol{f}(\boldsymbol{t})$ | $\boldsymbol{F}(\mathbf{s})$ |
| :--- | :--- |
| $\boldsymbol{\delta}(t)$, Impulse at $t=0$ | 1 |
| $u(t)$, Step at $t=0$ | $1 / \mathrm{s}$ |
| $\mathrm{t}[u(t)]$, Ramp at $t=0$ | $1 / \mathrm{s}^{2}$ |
| $e^{-\alpha t}$ | $1 /(\mathrm{s}+\alpha)$ |
| $t e^{-\alpha t}$ | $1 /(\mathrm{s}+\alpha)^{2}$ |
| $e^{-\alpha t} \sin \beta t$ | $\beta /\left[(\mathrm{s}+\alpha)^{2}+\beta^{2}\right]$ |
| $e^{-\alpha t} \cos \beta t$ | $\left.(\mathrm{~s}+\alpha) /(\mathrm{s}+\alpha)^{2}+\beta^{2}\right]$ |
| $\frac{d^{n} f(t)}{d t^{n}}$ | $s^{n} F(s)-\sum_{m=0}^{n-1} s^{n-m-1} \frac{d^{m} f(0)}{d^{m} t}$ |
| $\int_{0}^{t} f(\tau) d \tau$ | $(1 / s) F(s)$ |
| $\int_{0}^{t} x(t-\tau) h(t) d \tau$ | $H(s) X(s)$ |
| $f(\mathrm{t}-\tau)$ | $e^{-\tau s} F(s)$ |
| $\operatorname{limit}_{t \rightarrow \infty} f(t)$ | $\operatorname{limit}_{s \rightarrow 0} s F(s)$ |
| $\operatorname{limit}_{t \rightarrow 0} f(t)$ | $\operatorname{limit}_{s \rightarrow \infty} F(s)$ |

## DIFFERENCE EQUATIONS

Difference equations are used to model discrete systems. Systems which can be described by difference equations include computer program variables iteratively evaluated in a loop, sequential circuits, cash flows, recursive processes, systems with time-delay components, etc. Any system whose input $v(t)$ and output $y(t)$ are defined only at the equally spaced intervals $t=k T$ can be described by a difference equation.

## First-Order Linear Difference Equation

The difference equation

$$
P_{k}=P_{k-1}(1+i)-A
$$

represents the balance $P$ of a loan after the $k$ th payment $A$. If $P_{k}$ is defined as $y(k)$, the model becomes

$$
y(k)-(1+i) y(k-1)=-A
$$

## Second-Order Linear Difference Equation

The Fibonacci number sequence can be generated by

$$
y(k)=y(k-1)+y(k-2)
$$

where $y(-1)=1$ and $y(-2)=1$. An alternate form for this model is $f(\mathrm{k}+2)=f(k+1)+f(k)$

$$
\text { with } f(0)=1 \text { and } f(1)=1 .
$$

## z-Transforms

The transform definition is

$$
F(z)=\sum_{k=0}^{\infty} f(k) z^{-k}
$$

The inverse transform is given by the contour integral

$$
f(k)=\frac{1}{2 \pi i} \oint_{\Gamma} F(z) z^{k-1} d z
$$

and it represents a powerful tool for solving linear shift invariant difference equations. A limited unilateral list of $z$ transform pairs follows [Note: The last two transform pairs represent the Initial Value Theorem (I.V.T.) and the Final Value Theorem (F.V.T.) respectively.]:

| $\boldsymbol{f}(\boldsymbol{k})$ | $\boldsymbol{F}(\mathbf{z})$ |
| :--- | :--- |
| $\delta(k)$, Impulse at $k=0$ | 1 |
| $u(k)$, Step at $k=0$ | $1 /\left(1-\mathrm{z}^{-1}\right)$ |
| $\beta^{k}$ | $1 /\left(1-\beta z^{-1}\right)$ |
| $y(k-1)$ | $z^{-1} Y(z)+y(-1)$ |
| $y(k-2)$ | $z^{-2} Y(z)+y(-2)+y(-1) z^{-1}$ |
| $y(k+1)$ | $z Y(z)-z y(0)$ |
| $y(k+2)$ | $z^{2} Y(z)-z^{2} y(0)-z y(1)$ |
| $\sum_{m=0}^{\infty} X(k-m) h(m)$ | $H(z) X(z)$ |
| $\operatorname{limit}_{k \rightarrow 0} f(k)$ | $\operatorname{limit}_{z \rightarrow \infty} F(z)$ |
| $\operatorname{limit}_{k \rightarrow \infty} f(k)$ | $\operatorname{limit}_{z \rightarrow 1}\left(1-z^{-1}\right) F(z)$ |

## NUMERICAL METHODS

## Newton's Method of Root Extraction

Given a polynomial $P(x)$ with $n$ simple roots, $a_{1}, a_{2}, \ldots, a_{n}$ where

$$
\begin{aligned}
P(x) & =\prod_{m=1}^{n}\left(x-a_{m}\right) \\
& =x^{n}+\alpha_{1} x^{n-1}+\alpha_{2} x^{n-2}+\ldots+\alpha_{n}
\end{aligned}
$$

and $P\left(a_{i}\right)=0$. A root $a_{i}$ can be computed by the iterative algorithm

$$
a_{i}^{j+1}=a_{i}^{j}-\left.\frac{P(x)}{\partial P(x) / \partial x}\right|_{x=a_{i}^{j}}
$$

with $\left|P\left(a_{i}^{j+1}\right)\right| \leq\left|P\left(a_{i}^{j}\right)\right|$ Convergence is quadratic.
Newton's method may also be used for any function with a continuous first derivative.

## Newton's Method of Minimization

Given a scalar value function

$$
h(\boldsymbol{x})=h\left(x_{1}, x_{2}, \ldots, x_{n}\right)
$$

find a vector $\boldsymbol{x}^{*} \in R_{n}$ such that

$$
h\left(\boldsymbol{x}^{*}\right) \leq h(\boldsymbol{x}) \text { for all } \boldsymbol{x}
$$

Newton's algorithm is

$$
\begin{aligned}
\boldsymbol{x}_{K+1} & =\boldsymbol{x}_{K}-\left.\left(\left.\frac{\partial^{2} h}{\partial x^{2}}\right|_{\boldsymbol{x}=\boldsymbol{x}_{K}}\right)^{-1} \frac{\partial h}{\partial x}\right|_{\boldsymbol{x}=\boldsymbol{x}_{\mathrm{K}}}, \text { where } \\
\frac{\partial h}{\partial x} & =\left[\begin{array}{l}
\frac{\partial h}{\partial x_{1}} \\
\frac{\partial h}{\partial x_{2}} \\
\cdots \\
\cdots \\
\frac{\partial h}{\partial x_{n}}
\end{array}\right]
\end{aligned}
$$

and

$$
\frac{\partial^{2} h}{\partial x^{2}}=\left[\begin{array}{ccccc}
\frac{\partial^{2} h}{\partial x_{1}^{2}} & \frac{\partial^{2} h}{\partial x_{1} \partial x_{2}} & \cdots & \cdots & \frac{\partial^{2} h}{\partial x_{1} \partial x_{n}} \\
\frac{\partial^{2} h}{\partial x_{1} \partial x_{2}} & \frac{\partial^{2} h}{\partial x_{2}^{2}} & \cdots & \cdots & \frac{\partial^{2} h}{\partial x_{2} \partial x_{n}} \\
\cdots & \cdots & \cdots & \cdots & \cdots \\
\cdots & \cdots & \cdots & \cdots & \cdots \\
\frac{\partial^{2} h}{\partial x_{1} \partial x_{n}} & \frac{\partial^{2} h}{\partial x_{2} \partial x_{n}} & \cdots & \cdots & \frac{\partial^{2} h}{\partial x_{n}^{2}}
\end{array}\right]
$$

## Numerical Integration

Three of the more common numerical integration algorithms used to evaluate the integral

$$
\int_{a}^{b} f(x) d x
$$

are:

## Euler's or Forward Rectangular Rule

$$
\int_{a}^{b} f(x) d x \approx \Delta x \sum_{k=0}^{n-1} f(a+k \Delta x)
$$

## Trapezoidal Rule

for $n=1$

$$
\int_{a}^{b} f(x) d x \approx \Delta x\left[\frac{f(a)+f(b)}{2}\right]
$$

for $n>1$

$$
\int_{a}^{b} f(x) d x \approx \frac{\Delta x}{2}\left[f(a)+2 \sum_{k=1}^{n-1} f(a+k \Delta x)+f(b)\right]
$$

Simpson's Rule/Parabolic Rule ( $n$ must be an even integer)
for $n=2$

$$
\int_{a}^{b} f(x) d x \approx\left(\frac{b-a}{6}\right)\left[f(a)+4 f\left(\frac{a+b}{2}\right)+f(b)\right]
$$

for $n \geq 4$
$\int_{a}^{b} f(x) d x \approx \frac{\Delta x}{3}\left[\begin{array}{c}f(a)+2 \sum_{k=2,4,6, \ldots}^{n-2} f(a+k \Delta x) \\ +4 \sum_{k=1,3,5, \ldots}^{n-1} f(a+k \Delta x)+f(b)\end{array}\right]$
with $\quad \Delta x=(b-a) / n$

## Numerical Solution of Ordinary Differential Equations

Euler's Approximation
Given a differential equation

$$
d x / d t=f(x, t) \text { with } x(0)=x_{o}
$$

At some general time $k \Delta t$

$$
x[(k+1) \Delta t] \cong x(k \Delta t)+\Delta t f[x(k \Delta t), k \Delta t]
$$

which can be used with starting condition $x_{o}$ to solve recursively for $x(\Delta t), x(2 \Delta t), \ldots, x(n \Delta t)$.
The method can be extended to $n$th order differential equations by recasting them as $n$ first-order equations.
In particular, when $d x / d t=f(x)$

$$
x[(k+1) \Delta t] \cong x(k \Delta t)+\Delta t f[x(k \Delta t)]
$$

which can be expressed as the recursive equation

$$
x_{k+1}=x_{k}+\Delta t\left(d x_{k} / d t\right)
$$

## STATICS

## FORCE

A force is a vector quantity. It is defined when its (1) magnitude, (2) point of application, and (3) direction are known.

## RESULTANT (TWO DIMENSIONS)

The resultant, $F$, of $n$ forces with components $F_{x, i}$ and $F_{y, i}$ has the magnitude of

$$
F=\left[\left(\sum_{i=1}^{n} F_{x, i}\right)^{2}+\left(\sum_{i=1}^{n} F_{y, i}\right)^{2}\right]^{1 / 2}
$$

The resultant direction with respect to the $x$-axis using fourquadrant angle functions is

$$
\theta=\arctan \left(\sum_{i=1}^{n} F_{y, i} / \sum_{i=1}^{n} F_{x, i}\right)
$$

The vector form of the force is

$$
\boldsymbol{F}=F_{x} \mathbf{i}+F_{y} \mathbf{j}
$$

## RESOLUTION OF A FORCE

$F_{x}=F \cos \theta_{x} ; F_{y}=F \cos \theta_{y} ; F_{z}=F \cos \theta_{z}$
$\cos \theta_{x}=F_{x} / F ; \cos \theta_{y}=F_{y} / F ; \cos \theta_{z}=F_{z} / F$
Separating a force into components (geometry of force is known $R=\sqrt{x^{2}+y^{2}+z^{2}}$ )
$F_{x}=(x / R) F ; \quad F_{y}=(y / R) \mathrm{F} ; \quad F_{z}=(z / R) F$

## MOMENTS (COUPLES)

A system of two forces that are equal in magnitude, opposite in direction, and parallel to each other is called a couple.
A moment $\boldsymbol{M}$ is defined as the cross product of the radius vector distance $\boldsymbol{r}$ and the force $\boldsymbol{F}$ from a point to the line of action of the force.

$$
\boldsymbol{M}=\boldsymbol{r} \times \boldsymbol{F} ; \quad \begin{aligned}
& M_{x}=y F_{z}-z F_{y}, \\
& \\
& M_{y}=z F_{x}-x F_{z}, \text { and } \\
& \\
& M_{z}=x F_{y}-y F_{x} .
\end{aligned}
$$

## SYSTEMS OF FORCES

$$
\begin{aligned}
& \boldsymbol{F}=\Sigma \boldsymbol{F}_{n} \\
& \boldsymbol{M}=\Sigma\left(\boldsymbol{r}_{n} \times \boldsymbol{F}_{n}\right)
\end{aligned}
$$

## Equilibrium Requirements

$$
\begin{aligned}
& \Sigma \boldsymbol{F}_{n}=0 \\
& \Sigma \boldsymbol{M}_{n}=0
\end{aligned}
$$

## CENTROIDS OF MASSES, AREAS, LENGTHS, AND VOLUMES

Formulas for centroids, moments of inertia, and first moment of areas are presented in the MATHEMATICS section for continuous functions. The following discrete formulas are for defined regular masses, areas, lengths, and volumes:

$$
\boldsymbol{r}_{c}=\sum m_{n} \boldsymbol{r}_{n} / \sum m_{n} \text {, where }
$$

$m_{n}=$ the mass of each particle making up the system,
$\boldsymbol{r}_{n}=$ the radius vector to each particle from a selected reference point, and
$\boldsymbol{r}_{c}=$ the radius vector to the center of the total mass from the selected reference point.
The moment of area $\left(M_{a}\right)$ is defined as

$$
\begin{aligned}
M_{a y} & =\Sigma x_{n} a_{n} \\
M_{a x} & =\Sigma y_{n} a_{n} \\
M_{a z} & =\Sigma z_{n} a_{n}
\end{aligned}
$$

The centroid of area is defined as

$$
\left.\begin{array}{l}
x_{a c}=M_{a y} / A \backslash \text { with respect to center } \\
y_{a c}=M_{a x} / A \\
z_{a c}=M_{a z} / A
\end{array}\right\} \text { of the coordinate system }
$$

where $A=\Sigma a_{n}$
The centroid of a line is defined as

$$
\begin{aligned}
& x_{l c}=\left(\sum x_{n} l_{n}\right) / L, \text { where } L=\Sigma l_{n} \\
& y_{l c}=\left(\Sigma y_{n} l_{\mathrm{n}}\right) / L \\
& z_{l c}=\left(\sum z_{n} l_{n}\right) / L
\end{aligned}
$$

The centroid of volume is defined as

$$
\begin{aligned}
& x_{v c}=\left(\Sigma x_{n} v_{n}\right) / V, \text { where } V=\Sigma v_{n} \\
& y_{v c}=\left(\Sigma y_{n} v_{n}\right) / V \\
& z_{v c}=\left(\Sigma z_{n} v_{n}\right) / V
\end{aligned}
$$

## MOMENT OF INERTIA

The moment of inertia, or the second moment of area, is defined as

$$
\begin{aligned}
& I_{y}=\int x^{2} d A \\
& I_{x}=\int y^{2} d A
\end{aligned}
$$

The polar moment of inertia $J$ of an area about a point is equal to the sum of the moments of inertia of the area about any two perpendicular axes in the area and passing through the same point.

$$
\begin{aligned}
I_{z} & =J=I_{y}+I_{x}=\int\left(x^{2}+y^{2}\right) d A \\
& =r_{p}^{2} A, \text { where }
\end{aligned}
$$

$r_{p}=$ the radius of gyration (see page 23).

## Moment of Inertia Transfer Theorem

The moment of inertia of an area about any axis is defined as the moment of inertia of the area about a parallel centroidal axis plus a term equal to the area multiplied by the square of the perpendicular distance $d$ from the centroidal axis to the axis in question.

$$
\begin{aligned}
& I_{x}^{\prime}=I_{x_{c}}+d_{x}^{2} A \\
& I_{y}^{\prime}=I_{y_{c}}+d_{y}^{2} A, \text { where }
\end{aligned}
$$

$d_{x}, d_{y}=$ distance between the two axes in question,
$I_{x_{c}}, I_{y_{c}}=$ the moment of inertia about the centroidal axis, and $I_{x}^{\prime}, I_{y}^{\prime}=$ the moment of inertia about the new axis.

## Radius of Gyration

The radius of gyration $r_{p}, r_{x}, r_{y}$ is the distance from a reference axis at which all of the area can be considered to be concentrated to produce the moment of inertia.

$$
r_{x}=\sqrt{I_{x} / A} ; \quad r_{y}=\sqrt{I_{y} / A} ; \quad r_{p}=\sqrt{J / A}
$$

## Product of Inertia

The product of inertia ( $I_{x y}$, etc.) is defined as:
$I_{x y}=\int_{x y d} d$, with respect to the $x y$-coordinate system,
$I_{x z}=\int x z d A$, with respect to the $x z$-coordinate system, and
$I_{y z}=\int_{y z d A}$, with respect to the $y z$-coordinate system.
The transfer theorem also applies:
$I_{x y}^{\prime}=I_{x_{c} y_{c}}+d_{x} d_{y} A$ for the $x y$-coordinate system, etc.
where
$d_{x}=x$-axis distance between the two axes in question, and
$d_{y}=y$-axis distance between the two axes in question.

## FRICTION

The largest frictional force is called the limiting friction. Any further increase in applied forces will cause motion.

$$
F=\mu N \text {, where }
$$

$F=$ friction force,
$\mu=$ coefficient of static friction, and
$N=$ normal force between surfaces in contact.

## SCREW THREAD

For a screw-jack, square thread,

$$
M=\operatorname{Pr} \tan (\alpha \pm \phi), \text { where }
$$

+ is for screw tightening,
- is for screw loosening,
$M$ = external moment applied to axis of screw,
$P=$ load on jack applied along and on the line of the axis,
$r=$ the mean thread radius,
$\alpha=$ the pitch angle of the thread, and
$\mu=\tan \phi=$ the appropriate coefficient of friction.

## BRAKE-BAND OR BELT FRICTION

$F_{1}=F_{2} e^{\mu \theta}$, where
$F_{1}=$ force being applied in the direction of impending motion,
$F_{2}=$ force applied to resist impending motion,
$\mu=$ coefficient of static friction, and
$\theta=$ the total angle of contact between the surfaces expressed in radians.

## STATICALLY DETERMINATE TRUSS

## Plane Truss

A plane truss is a rigid framework satisfying the following conditions:

1. The members of the truss lie in the same plane.
2. The members are connected at their ends by frictionless pins.
3. All of the external loads lie in the plane of the truss and are applied at the joints only.
4. The truss reactions and member forces can be determined using the equations of equilibrium.

$$
\Sigma \boldsymbol{F}=0 ; \Sigma \boldsymbol{M}=0
$$

5. A truss is statically indeterminate if the reactions and member forces cannot be solved with the equations of equilibrium.

## Plane Truss: Method of Joints

The method consists of solving for the forces in the members by writing the two equilibrium equations for each joint of the truss.
$\Sigma F_{V}=0$ and $\Sigma F_{H}=0$, where
$F_{H}=$ horizontal forces and member components and
$F_{V}=$ vertical forces and member components.

## Plane Truss: Method of Sections

The method consists of drawing a free-body diagram of a portion of the truss in such a way that the unknown truss member force is exposed as an external force.

## CONCURRENT FORCES

A system of forces wherein their lines of action all meet at one point.

## Two Dimensions

$$
\Sigma F_{x}=0 ; \Sigma F_{y}=0
$$

## Three Dimensions

$\Sigma F_{x}=0 ; \Sigma F_{y}=0 ; \Sigma F_{z}=0$

## DYNAMICS

## KINEMATICS

Vector representation of motion in space: Let $\boldsymbol{r}(t)$ be the position vector of a particle. Then the velocity is
$\boldsymbol{v}=d \boldsymbol{r} / d t$, where
$\boldsymbol{v}=$ the instantaneous velocity of the particle, (length/time), and
$t=$ time.
The acceleration is

$$
\boldsymbol{a}=d \boldsymbol{v} / d t=d^{2} \boldsymbol{r} / d t^{2} \text {, where }
$$

$\boldsymbol{a}=$ the instantaneous acceleration of the particle, (length/time/time).

## Rectangular Coordinates

$$
\begin{aligned}
& \boldsymbol{r}=x \boldsymbol{i}+y \boldsymbol{j}+z \boldsymbol{k} \\
& \boldsymbol{v}=d \boldsymbol{r} / d t=\dot{x} \boldsymbol{i}+\ddot{y} \boldsymbol{j}+\dot{z} \boldsymbol{k} \\
& \boldsymbol{a}=d^{2} \boldsymbol{r} / d t^{2}=\ddot{x} \boldsymbol{i}+\ddot{\boldsymbol{j}}+\ddot{z} \boldsymbol{k}, \text { where } \\
& \dot{x}=d x / d t=v_{x}, \text { etc. } \\
& \ddot{x}=d^{2} x / d t^{2}=a_{x}, \text { etc. }
\end{aligned}
$$

## Transverse and Radial Components for Planar Problems

Unit vectors $\boldsymbol{e}_{r}$ and $\boldsymbol{e}_{\boldsymbol{\theta}}$ are, respectively, colinear with and normal to the position vector.

$$
\begin{aligned}
& \boldsymbol{r}=r \boldsymbol{e}_{r} \\
& \boldsymbol{v}=\dot{\boldsymbol{r}} \boldsymbol{e}_{r}+r \dot{\theta} \boldsymbol{e}_{\theta} \\
& \boldsymbol{a}=\left(\ddot{r}-r \dot{\theta}^{2}\right) \boldsymbol{e}_{r}+(r \ddot{\theta}+2 \dot{\boldsymbol{r}}) \boldsymbol{e}_{\theta}, \text { where }
\end{aligned}
$$

$r=$ the radius,
$\theta=$ the angle between the x -axis and $r$,
$\dot{r}=d r / d t$, etc., and
$\ddot{r}=d^{2} r / d t^{2}$, etc.

## Tangential and Normal Components

Unit vectors $\boldsymbol{e}_{n}$ and $\boldsymbol{e}_{t}$ are, respectively, normal and tangent to the path.

$$
\begin{aligned}
& \boldsymbol{v}=v_{\boldsymbol{e}} \boldsymbol{e}_{t} \\
& \boldsymbol{a}=\left(d v_{t} / d t\right) \boldsymbol{e}_{t}+\left(v_{t}^{2} / \rho\right) \boldsymbol{e}_{n}, \text { where }
\end{aligned}
$$

$\rho=$ instantaneous radius of curvature, and
$v_{t}=$ tangential velocity.

## Plane Circular Motion

Rotation about the origin with constant radius: The unit vectors are $\boldsymbol{e}_{t}=\boldsymbol{e}_{\theta}$ and $\boldsymbol{e}_{r}=-\boldsymbol{e}_{n}$.
Angular velocity

$$
\omega=\dot{\theta}=v_{t} / r
$$

Angular acceleration

$$
\begin{aligned}
& \alpha=\dot{\omega}=\ddot{\theta}=a_{t} / r \\
& s=r \theta \\
& v_{t}=r \omega
\end{aligned}
$$

Tangential acceleration

$$
a_{t}=r \alpha=d v_{t} / d t
$$

Normal acceleration

$$
a_{n}=v_{t}^{2} / r=r \omega^{2}
$$

## Straight Line Motion

Constant acceleration equations:

$$
\begin{aligned}
& s=s_{0}+v_{0} t+\left(a_{0} t^{2}\right) / 2 \\
& v=v_{0}+a_{0} t \\
& v^{2}=v_{0}^{2}+2 a_{0}\left(s-s_{0}\right), \text { where }
\end{aligned}
$$

$s=$ distance along the line traveled,
$s_{0}=$ an initial distance from origin (constant),
$v_{\mathrm{o}}=$ an initial velocity (constant),
$a_{\mathrm{o}}=$ a constant acceleration,
$t=$ time, and
$v=$ velocity at time $t$.
For a free-falling body, $a_{0}=g$ (downward)
Using variable velocity, $v(t)$

$$
s=s_{o}+\int_{0}^{t} v(t) d t
$$

Using variable acceleration, $a(t)$

$$
v=v_{o}+\int_{0}^{t} a(t) d t
$$

## PROJECTILE MOTION

$a_{x}=0 ; \quad a_{y}=-g$
$v_{x}=v_{x 0}=v_{\mathrm{o}} \cos \theta$
$v_{y}=v_{y 0}-g t=v_{0} \sin \theta-g t$
$x=v_{x 0} t=v_{0} t \cos \theta$
$y=v_{y 0} t-g t^{2} / 2=v_{0} t \sin \theta-g t^{2} / 2$

## CONCEPT OF WEIGHT

$$
W=m g \text {, where }
$$

$W=$ weight, N (lbf),
$m=$ mass, $\mathrm{kg}\left(\mathrm{lbf}-\mathrm{sec}^{2} / \mathrm{ft}\right)$, and
$g=$ local acceleration of gravity, $\mathrm{m} / \sec ^{2}\left(\mathrm{ft} / \sec ^{2}\right)$.

## KINETICS

Newton's second law for a particle

$$
\Sigma \boldsymbol{F}=d(m \boldsymbol{v}) / d t, \text { where }
$$

$\Sigma \boldsymbol{F}=$ the sum of the applied forces acting on the particle, N (lbf).

## One-Dimensional Motion of Particle

When referring to motion in the $x$-direction,

$$
a_{x}=F_{x} / m \text {, where }
$$

$F_{x}=$ the resultant of the applied forces in the $x$-direction. $F_{x}$ can depend on $t, x$ and $v_{x}$ in general.
If $F_{x}$ depends only on $t$, then

$$
\begin{aligned}
& v_{x}(t)=v_{x 0}+\int_{0}^{t}\left[F_{x}\left(t^{\prime}\right) / m\right] d t^{\prime} \\
& x(t)=x_{0}+v_{x 0} t+\int_{0}^{t} v_{x}\left(t^{\prime}\right) d t^{\prime}
\end{aligned}
$$

If the force is constant (independent of time, displacement, or velocity),

$$
\begin{aligned}
a_{x} & =F_{x} / m \\
v_{x} & =v_{x 0}+\left(F_{x} / m\right) t=v_{x 0}+a_{x} t \\
x & =x_{0}+v_{x 0} t+F_{x} t^{2} /(2 m) \\
& =x_{0}+v_{x 0} t+a_{x} t^{2} / 2
\end{aligned}
$$

## Tangential and Normal Kinetics for Planar Problems

Working with the tangential and normal directions,

$$
\begin{aligned}
& \Sigma F_{t}=m a_{t}=m d v_{t} / d t \text { and } \\
& \Sigma F_{n}=m a_{n}=m\left(v_{t}^{2} / \rho\right)
\end{aligned}
$$

## Impulse and Momentum

Assuming the mass is constant, the equation of motion is

$$
\begin{aligned}
& m d v_{x} / d t=F_{x} \\
& m d v_{x}=F_{x} d t \\
& m\left[v_{x}(t)-v_{x}(0)\right]=\int_{0}^{t} F_{x}\left(t^{\prime}\right) d t^{\prime}
\end{aligned}
$$

The left side of the equation represents the change in linear momentum of a body or particle. The right side is termed the impulse of the force $F_{x}\left(t^{\prime}\right)$ between $t^{\prime}=0$ and $t^{\prime}=t$.

## Work and Energy

Work $W$ is defined as

$$
W=\int \boldsymbol{F} \cdot d \boldsymbol{r}
$$

(For particle flow, see FLUID MECHANICS section.)

## Kinetic Energy

The kinetic energy of a particle is the work done by an external agent in accelerating the particle from rest to a velocity $v$.

$$
T=m v^{2} / 2
$$

In changing the velocity from $v_{1}$ to $v_{2}$, the change in kinetic energy is

$$
T_{2}-T_{1}=m v_{2}^{2} / 2-m v_{1}^{2} / 2
$$

## Potential Energy

The work done by an external agent in the presence of a conservative field is termed the change in potential energy.

For a constant mass,

## Potential Energy in Gravity Field

$$
U=m g h, \text { where }
$$

$h=$ the elevation above a specified datum.

## Elastic Potential Energy

For a linear elastic spring with modulus, stiffness, or spring constant $k$, the force is

$$
F_{s}=k x \text {, where }
$$

$x=$ the change in length of the spring from the undeformed length of the spring.
The potential energy stored in the spring when compressed or extended by an amount $x$ is

$$
U=k x^{2} / 2
$$

The change of potential energy in deforming a spring from position $x_{1}$ to position $x_{2}$ is

$$
U_{2}-U_{1}=k x_{2}^{2} / 2-k x_{1}^{2} / 2
$$

## Principle of Work and Energy

If $T_{i}$ and $U_{i}$ are kinetic energy and potential energy at state $i$, then for conservative systems (no energy dissipation), the law of conservation of energy is

$$
U_{1}+T_{1}=U_{2}+T_{2} .
$$

If nonconservative forces are present, then the work done by these forces must be accounted for.

$$
U_{1}+T_{1}+W_{1 \rightarrow 2}=U_{2}+T_{2}
$$

(Care must be exercised during computations to correctly compute the algebraic sign of the work term).

## Impact

Momentum is conserved while energy may or may not be conserved. For direct central impact with no external forces

$$
m_{1} \boldsymbol{v}_{1}+m_{2} \boldsymbol{v}_{2}=m_{1} \boldsymbol{v}_{1}^{\prime}+m_{2} \boldsymbol{v}_{2}^{\prime} \text {, where }
$$

$m_{1}, m_{2}=$ the masses of the two bodies,
$\boldsymbol{v}_{1}, \boldsymbol{v}_{2}=$ their velocities before impact, and
$\boldsymbol{v}_{1}^{\prime}, \boldsymbol{v}_{2}^{\prime}=$ their velocities after impact.
For impact with dissipation of energy, the relative velocity expression is

$$
e=\frac{v_{2_{n}}^{\prime}-v_{1_{n}}^{\prime}}{v_{1_{n}}-v_{2_{n}}} \text {, where }
$$

$e=$ the coefficient of restitution for the materials, and the subscript $n$ denotes the components normal to the plane of impact.
Knowing $e$, the velocities after rebound are

$$
\begin{aligned}
& v_{1_{n}}^{\prime}=\frac{m_{2} v_{2_{n}}(1+e)+\left(m_{1}-e m_{2}\right) v_{1_{n}}}{m_{1}+m_{2}} \\
& v_{2}^{\prime}=\frac{m_{1} v_{1_{n}}(1+e)-\left(e m_{1}-m_{2}\right) v_{2_{n}}}{m_{1}+m_{2}}
\end{aligned}
$$

where $0 \leq e \leq 1$,
$e=1$, perfectly elastic, and

$$
e=0 \text {, perfectly plastic (no rebound). }
$$

## FRICTION

The Laws of Friction are

1. The total friction force $F$ that can be developed is independent of the magnitude of the area of contact.
2. The total friction force $F$ that can be developed is proportional to the normal force $N$.
3. For low velocities of sliding, the total friction force that can be developed is practically independent of the velocity, although experiments show that the force $F$ necessary to start sliding is greater than that necessary to maintain sliding.
The formula expressing the laws of friction is

$$
F=\mu N \text {, where }
$$

$\mu=$ the coefficient of friction.
Static friction will be less than or equal to $\mu_{s} N$, where $\mu_{s}$ is the coefficient of static friction. At the point of impending motion,

$$
F=\mu_{s} N
$$

When motion is present

$$
F=\mu_{k} N \text {, where }
$$

$\mu_{k}=$ the coefficient of kinetic friction. The value of $\mu_{k}$ is often taken to be $75 \%$ of $\mu_{s}$.
Belt friction is discussed in the STATICS section.

## MASS MOMENT OF INERTIA

$$
I_{z}=\int\left(x^{2}+y^{2}\right) d m
$$

A table listing moment of inertia formulas is available at the end of this section for some standard shapes.

## Parallel Axis Theorem

$$
I_{z}=I_{z c}+m d^{2} \text {, where }
$$

$I_{z}=$ the mass moment of inertia about a specific axis (in this case, the $z$-axis),
$I_{z c}=$ the mass moment of inertia about the body's mass center (in this case, parallel to the $z$-axis),
$m=$ the mass of the body, and
$d=$ the normal distance from the mass center to the specific axis desired (in this case, the $z$-axis).
Also,
$I_{z}=m r_{z}^{2}$, where
$m=$ the total mass of the body, and
$r_{z}=$ the radius of gyration (in this case, about the $z$ axis).

## PLANE MOTION OF A RIGID BODY

For a rigid body in plane motion in the $x-y$ plane

$$
\begin{aligned}
& \Sigma F_{x}=m a_{x c} \\
& \Sigma F_{y}=m a_{y c} \\
& \Sigma M_{z c}=I_{z c} \alpha, \text { where }
\end{aligned}
$$

$c=$ the center of gravity, and
$\alpha=$ angular acceleration of the body.

## Rotation About a Fixed Axis

$$
\Sigma M_{O}=I_{O} \alpha, \text { where }
$$

$O$ denotes the axis about which rotation occurs.
For rotation about a fixed axis caused by a constant applied moment $M$

$$
\begin{aligned}
\alpha & =M / I \\
\omega & =\omega_{O}+(M / I) t \\
\theta & =\theta_{O}+\omega_{O} t+(M / 2 I) t^{2}
\end{aligned}
$$

The change in kinetic energy of rotation is the work done in accelerating the rigid body from $\omega_{O}$ to $\omega$.

$$
I_{O} \omega^{2} / 2-I_{O} \omega_{O}^{2} / 2=\int_{\theta_{O}}^{\theta} M d \theta
$$

## Kinetic Energy

The kinetic energy of a body in plane motion is

$$
T=m\left(v_{x c}^{2}+v_{y c}^{2}\right) / 2+I_{c} \omega^{2} / 2
$$

## Instantaneous Center of Rotation

The instantaneous center of rotation for a body in plane motion is defined as that position about which all portions of that body are rotating.
-

$\mathrm{AC} \dot{\theta}=\mathrm{r} \omega$, and
$\mathrm{v}_{\mathrm{b}}=\mathrm{BC} \dot{\theta}$, where
$\mathrm{C}=$ the instantaneous center of rotation,
$\dot{\theta}=$ the rotational velocity about $C$, and
$\mathrm{AC}, \mathrm{BC}=$ radii determined by the geometry of the situation.

## CENTRIFUGAL FORCE

For a rigid body (of mass $m$ ) rotating about a fixed axis, the centrifugal force of the body at the point of rotation is

$$
F_{c}=m r \omega^{2}=m v^{2} / r \text {, where }
$$

$r=$ the distance from the center of rotation to the center of the mass of the body.

## BANKING OF CURVES (WITHOUT FRICTION)

$\tan \theta=v^{2} /(g r)$, where
$\theta=$ the angle between the roadway surface and the horizontal,
$v=$ the velocity of the vehicle, and
$r=$ the radius of the curve.

## FREE VIBRATION

The equation of motion is

$$
m \ddot{x}=m g-k\left(x+\delta_{s t}\right)
$$

From static equilibrium

$$
m g=k \delta_{s t}
$$

where
$\mathrm{k}=$ the spring constant, and
$\delta_{s t}=$ the static deflection of the spring supporting the weight ( mg ).
The above equation of motion may now be rewritten as

$$
\begin{aligned}
& m \ddot{x}+k x=0, \quad \text { or } \\
& \ddot{x}+(k / m) x=0 .
\end{aligned}
$$

The solution to this differential equation is

$$
x(t)=C_{1} \cos \sqrt{(k / m)} t+C_{2} \sin \sqrt{(k / m)} t \text {, where }
$$

$x(t)=$ the displacement in the $x$-direction, and
$C_{1}, C_{2}=$ constants of integration whose values depend on the initial conditions of the problem.
The quantity $\sqrt{k / m}$ is called the undamped natural frequency $\omega_{n}$ or $\omega_{n}=\sqrt{k / m}$

[^1]From the static deflection relation

$$
\omega_{n}=\sqrt{g / \delta_{s t}}
$$

The period of vibration is

$$
\tau=2 \pi / \omega_{n}=2 \pi \sqrt{m / k}=2 \pi \sqrt{\delta_{s t} / g}
$$

If the initial conditions are $x(0)=x_{0}$ and $\dot{x}(0)=v_{0}$, then

$$
x(t)=x_{0} \cos \omega_{n} t+\left(v_{0} / \omega_{n}\right) \sin \omega_{n} t
$$

If the initial conditions are $x(0)=x_{0}$ and $\dot{x}(0)=0$, then

$$
x(t)=x_{0} \cos \omega_{n} t
$$

which is the equation for simple harmonic motion where the amplitude of vibration is $x_{0}$.

## Torsional Free Vibration

$\ddot{\theta}+\omega_{n}^{2} \theta=0$, where
$\omega_{n}=\sqrt{k_{t} / I}=\sqrt{G J / I L}$,
$k_{t}=$ the torsional spring constant $=G J / L$,
$I=$ the mass moment of inertia of the body,
$G=$ the shear modulus,
$J=$ the area polar moment of inertia of the round shaft cross section, and
$L \quad=$ the length of the round shaft.

The solution to the equation of motion is

$$
\theta=\theta_{0} \cos \omega_{n} t+\left(\dot{\theta}_{0} / \omega_{n}\right) \sin \omega_{n} t, \text { where }
$$

$\theta_{0}=$ the initial angle of rotation and
$\dot{\theta}_{0}=$ the initial angular velocity.
The undamped circular natural frequency of torsional vibration is

$$
\omega_{n}=\sqrt{G J / I L}
$$

The period of torsional vibration is

$$
\tau=2 \pi / \omega_{n}=2 \pi \sqrt{I L / G J}
$$

## MECHANICS OF MATERIALS

## UNIAXIAL STRESS-STRAIN

Stress-Strain Curve for Mild Steel

The slope of the linear portion of the curve equals the modulus of elasticity.

## Engineering Strain

$\varepsilon=\Delta \mathrm{L} / \mathrm{L}_{0}$, where
$\varepsilon=$ engineering strain (units per unit),
$\Delta L=$ change in length (units) of member,
$L_{0}=$ original length (units) of member,
$\varepsilon_{p l}=$ plastic deformation (permanent), and
$\varepsilon_{e l}=$ elastic deformation (recoverable).
Equilibrium requirements: $\Sigma \boldsymbol{F}=0 ; \Sigma \boldsymbol{M}=0$
Determine geometric compatibility with the restraints. Use a linear force-deformation relationship;

$$
F=k \delta .
$$

## DEFINITIONS

Shear Stress-Strain
$\gamma=\tau / G$, where
$\gamma=$ shear strain,
$\tau=$ shear stress, and
$G=$ shear modulus (constant in linear force-deformation relationship).

$$
G=\frac{E}{2(1+v)}, \text { where }
$$

$\mathrm{E}=$ modulus of elasticity
$v=$ Poisson's ratio, and
$=-$ (lateral strain)/(longitudinal strain).

Uniaxial Loading and Deformation

$$
\sigma=P / A \text {, where }
$$

$\sigma=$ stress on the cross section,
$P=$ loading, and
$A=$ cross-sectional area.
$\varepsilon=\delta / L$, where
$\delta=$ longitudinal deformation and
$L=$ length of member.

$$
\begin{aligned}
& E=\sigma / \varepsilon=\frac{P / A}{\delta / L} \\
& \delta=\frac{P L}{A E}
\end{aligned}
$$

## THERMAL DEFORMATIONS

$\delta_{t}=\alpha L\left(T-T_{o}\right)$, where
$\delta_{t}=$ deformation caused by a change in temperature,
$\alpha=$ temperature coefficient of expansion,
$L=$ length of member,
$T=$ final temperature, and
$T_{o}=$ initial temperature.

## CYLINDRICAL PRESSURE VESSEL

## Cylindrical Pressure Vessel

For internal pressure only, the stresses at the inside wall are:

$$
\sigma_{t}=P_{i} \frac{r_{o}^{2}+r_{i}^{2}}{r_{o}^{2}-r_{i}^{2}} \text { and } 0>\sigma_{r}>-P_{i}
$$

For external pressure only, the stresses at the outside wall are:

$$
\sigma_{t}=-P_{o} \frac{r_{o}^{2}+r_{i}^{2}}{r_{o}^{2}-r_{i}^{2}} \text { and } 0>\sigma_{r}>-P_{o} \text {, where }
$$

$\sigma_{t}=$ tangential (hoop) stress,
$\sigma_{r}=$ radial stress,
$P_{i}=$ internal pressure,
$P_{o}=$ external pressure,
$r_{i}=$ inside radius, and
$r_{o}=$ outside radius.
For vessels with end caps, the axial stress is:

$$
\sigma_{a}=P_{i} \frac{r_{i}^{2}}{r_{o}^{2}-r_{i}^{2}}
$$

These are principal stresses.

When the thickness of the cylinder wall is about one-tenth or less, of inside radius, the cylinder can be considered as thin-walled. In which case, the internal pressure is resisted by the hoop stress

$$
\sigma_{t}=\frac{P_{i} r}{t} \quad \text { and } \quad \sigma_{a}=\frac{P_{i} r}{2 t}
$$

where $t=$ wall thickness.

## STRESS AND STRAIN

## Principal Stresses

For the special case of a two-dimensional stress state, the equations for principal stress reduce to

$$
\begin{aligned}
& \sigma_{a}, \sigma_{b}=\frac{\sigma_{x}+\sigma_{y}}{2} \pm \sqrt{\left(\frac{\sigma_{x}-\sigma_{y}}{2}\right)^{2}+\tau_{x y}^{2}} \\
& \sigma_{c}=0
\end{aligned}
$$

The two nonzero values calculated from this equation are temporarily labeled $\sigma_{a}$ and $\sigma_{b}$ and the third value $\sigma_{c}$ is always zero in this case. Depending on their values, the three roots are then labeled according to the convention: algebraically largest $=\sigma_{1}$, algebraically smallest $=\sigma_{3}$, other $=\sigma_{2}$. A typical 2D stress element is shown below with all indicated components shown in their positive sense.

## Mohr's Circle - Stress, 2D

To construct a Mohr's circle, the following sign conventions are used.

1. Tensile normal stress components are plotted on the horizontal axis and are considered positive. Compressive normal stress components are negative.
2. For constructing Mohr's circle only, shearing stresses are plotted above the normal stress axis when the pair of shearing stresses, acting on opposite and parallel faces of an element, forms a clockwise couple. Shearing stresses are plotted below the normal axis when the shear stresses form a counterclockwise couple.

The circle drawn with the center on the normal stress (horizontal) axis with center, C , and radius, $R$, where

$$
C=\frac{\sigma_{x}+\sigma_{y}}{2}, \quad R=\sqrt{\left(\frac{\sigma_{x}-\sigma_{y}}{2}\right)^{2}+\tau_{x y}^{2}}
$$

The two nonzero principal stresses are then:

$$
\begin{aligned}
\sigma_{a} & =C+R \\
\sigma_{b} & =C-R
\end{aligned}
$$

The maximum inplane shear stress is $\tau_{\text {in }}=R$. However, the maximum shear stress considering three dimensions is always

$$
\tau_{\max }=\frac{\sigma_{1}-\sigma_{3}}{2} .
$$

## Hooke's Law

Three-dimensional case:

$$
\begin{array}{ll}
\varepsilon_{x}=(1 / E)\left[\sigma_{x}-v\left(\sigma_{y}+\sigma_{z}\right)\right] & \gamma_{x y}=\tau_{x y} / G \\
\varepsilon_{y}=(1 / E)\left[\sigma_{y}-v\left(\sigma_{z}+\sigma_{x}\right)\right] & \gamma_{y z}=\tau_{y z} / G \\
\varepsilon_{z}=(1 / E)\left[\sigma_{z}-v\left(\sigma_{x}+\sigma_{y}\right)\right] & \gamma_{z x}=\tau_{z x} / G
\end{array}
$$

Plane stress case ( $\sigma_{z}=0$ ):
$\varepsilon_{x}=(1 / E)\left(\sigma_{x}-v \sigma_{y}\right)$
$\varepsilon_{y}=(1 / E)\left(\sigma_{y}-v \sigma_{x}\right)$
$\varepsilon_{z}=-(1 / E)\left(v \sigma_{x}+v \sigma_{y}\right)$

$$
\left\{\begin{array}{l}
\sigma_{x} \\
\sigma_{y} \\
\tau_{x y}
\end{array}\right\}=\frac{E}{1-v^{2}}\left[\begin{array}{ccc}
1 & v & 0 \\
v & 1 & 0 \\
0 & 0 & \frac{1-v}{2}
\end{array}\right]\left\{\begin{array}{l}
\varepsilon_{x} \\
\varepsilon_{y} \\
\gamma_{x y}
\end{array}\right\}
$$

Uniaxial case $\left(\sigma_{y}=\sigma_{z}=0\right)$ : $\quad \sigma_{\mathrm{x}}=\mathrm{E} \varepsilon_{x}$ or $\sigma=\mathrm{E} \varepsilon$, where
$\varepsilon_{\mathrm{x}}, \varepsilon_{\mathrm{y}}, \varepsilon_{\mathrm{z}}=$ normal strain,
$\sigma_{x}, \sigma_{y}, \sigma_{z}=$ normal stress,
$\gamma_{\mathrm{xy}}, \gamma_{\mathrm{yz}}, \gamma_{\mathrm{zx}}=$ shear strain,
$\tau_{\mathrm{xy}}, \tau_{\mathrm{yz}}, \tau_{\mathrm{zx}}=$ shear stress,
$E=$ modulus of elasticity,
$G=$ shear modulus, and
$v=$ Poisson's ratio.

## STATIC LOADING FAILURE THEORIES

## Maximum-Normal-Stress Theory

The maximum-normal-stress theory states that failure occurs when one of the three principal stresses equals the strength of the material. If $\sigma_{1}>\sigma_{2}>\sigma_{3}$, then the theory predicts that failure occurs whenever $\sigma_{1} \geq S_{t}$ or $\sigma_{3} \leq-S_{c}$ where $S_{t}$ and $S_{c}$ are the tensile and compressive strengths, respectively.

## Maximum-Shear-Stress Theory

The maximum-shear-stress theory states that yielding begins when the maximum shear stress equals the maximum shear stress in a tension-test specimen of the same material when that specimen begins to yield. If $\sigma_{1} \geq \sigma_{2} \geq \sigma_{3}$, then the theory predicts that yielding will occur whenever $\tau_{\max } \geq S_{y} / 2$ where $S_{y}$ is the yield strength.

## Distortion-Energy Theory

The distortion-energy theory states that yielding begins whenever the distortion energy in a unit volume equals the distortion energy in the same volume when uniaxially stressed to the yield strength. The theory predicts that yielding will occur whenever

$$
\left[\frac{\left(\sigma_{1}-\sigma_{2}\right)^{2}+\left(\sigma_{2}-\sigma_{3}\right)^{2}+\left(\sigma_{1}-\sigma_{3}\right)^{2}}{2}\right]^{1 / 2} \geq S_{y}
$$

## TORSION

$$
\gamma_{\phi z}=\operatorname{limit}_{\Delta z \rightarrow 0} r(\Delta \phi / \Delta z)=r(d \phi / d z)
$$

The shear strain varies in direct proportion to the radius, from zero strain at the center to the greatest strain at the outside of the shaft. $d \phi / d z$ is the twist per unit length or the rate of twist.

$$
\begin{aligned}
& \tau_{\phi z}=G \gamma_{\phi z}=G \mathrm{r}(d \phi / d z) \\
& T=G(d \phi / d z) \int_{A} r^{2} d A=G J(d \phi / d z), \text { where }
\end{aligned}
$$

$J=$ polar moment of inertia (see table at end of DYNAMICS section).
$\phi=\int_{o}^{L} \frac{T}{G J} d z=\frac{T L}{G J}$, where
$\phi=$ total angle (radians) of twist,
$T=$ torque, and
$L=$ length of shaft.
$\tau_{\phi z}=G r[T /(G J)]=T r / J$
$\frac{T}{\phi}=\frac{G J}{L}$, where
$T / \phi$ gives the twisting moment per radian of twist. This is called the torsional stiffness and is often denoted by the symbol $k$ or $c$.

## For Hollow, Thin-Walled Shafts

$\tau=\frac{T}{2 A_{m}}$, where
$t=$ thickness of shaft wall and
$A_{m}=$ the total mean area enclosed by the shaft measured to the midpoint of the wall.

## BEAMS

## Shearing Force and Bending Moment Sign Conventions

1. The bending moment is positive if it produces bending of the beam concave upward (compression in top fibers and tension in bottom fibers).
2. The shearing force is positive if the right portion of the beam tends to shear downward with respect to the left.

- positive bending negative bending

POSITIVE SHEAR

NEGATIVE SHEAR

The relationship between the load $(q)$, shear ( $V$ ), and moment ( $M$ ) equations are:

$$
\begin{aligned}
& q(x)=-\frac{d V(x)}{d x} \\
& V=\frac{d M(x)}{d x} \\
& V_{2}-V_{1}=\int_{x_{1}}^{x^{2}}[-q(x)] d x \\
& M_{2}-M_{1}=\int_{x_{1}}^{x^{2}} V(x) d x
\end{aligned}
$$

## Stresses in Beams

$\boldsymbol{\varepsilon}_{x}=-y / \rho$, where
$\rho=$ the radius of curvature of the deflected axis of the beam, and
$y=$ the distance from the neutral axis to the longitudinal fiber in question.
Using the stress-strain relationship $\sigma=E \varepsilon$,
Axial Stress: $\quad \sigma_{x}=-E y / \rho$, where
$\sigma_{x}=$ the normal stress of the fiber located $y$-distance from the neutral axis.
$1 / \rho=M /(E I)$, where
$M=$ the moment at the section and
$I=$ the moment of inertia of the cross-section.
$\sigma_{x}=-M y / I$, where
$y=$ the distance from the neutral axis to the fiber location above or below the axis. Let $y=c$, where $c$ $=$ distance from the neutral axis to the outermost fiber of a symmetrical beam section.
$\sigma_{x}= \pm M c / I$
Let $S=I / c$ : then, $\sigma_{x}= \pm M / S$, where
$S=$ the elastic section modulus of the beam member.
Transverse shear flow: $q=V Q / I$ and
Transverse shear stress: $\tau_{x y}=V Q /(I b)$, where
$q=$ shear flow,
$\tau_{x y}=$ shear stress on the surface,
$V=$ shear force at the section,
$b=$ width or thickness of the cross-section, and
$Q=A^{\prime} \bar{y}^{\prime}$, where
$A^{\prime}=$ area above the layer (or plane) upon which the desired transverse shear stress acts and
$\bar{y}^{\prime}=$ distance from neutral axis to area centroid.

- Timoshenko, S. \& Gleason H. MacCullough, Elements of Strength of Materials, ©1949 by K. Van Nostrand Co. Used with permission from Wadsworth Publishing Co.

## Deflection of Beams

Using $1 / \rho=M /(E I)$ ，

$$
E I \frac{d^{2} y}{d x^{2}}=M \text {, differential equation of deflection curve }
$$

$$
E I \frac{d^{3} y}{d x^{3}}=d M(x) / d x=V
$$

$$
E I \frac{d^{4} y}{d x^{4}}=d V(x) / d x=-q
$$

Determine the deflection curve equation by double integration（apply boundary conditions applicable to the deflection and／or slope）．

$$
\begin{aligned}
& E I(d y / d x)=\int M(x) d x \\
& E I y=\int\left[\int M(x) d x\right] d x
\end{aligned}
$$

The constants of integration can be determined from the physical geometry of the beam．

## COLUMNS

For long columns with pinned ends：
Euler＇s Formula

$$
P_{c r}=\frac{\pi^{2} E I}{\ell^{2}}, \text { where }
$$

$P_{\text {cr }}=$ critical axial loading，
$\ell=$ unbraced column length．
substitute $I=\mathrm{r}^{2} \mathrm{~A}$ ：

$$
\frac{P_{c r}}{A}=\frac{\pi^{2} E}{(\ell / r)^{2}}, \text { where }
$$

$\mathrm{r}=$ radius of gyration and
$\ell / r=$ slenderness ratio for the column．
For further column design theory，see the CIVIL
ENGINEERING and MECHANICAL ENGINEERING sections．

## ELASTIC STRAIN ENERGY

If the strain remains within the elastic limit，the work done during deflection（extension）of a member will be transformed into potential energy and can be recovered．
If the final load is $P$ and the corresponding elongation of a tension member is $\delta$ ，then the total energy $U$ stored is equal to the work $W$ done during loading．

$$
U=W=P \delta / 2
$$

The strain energy per unit volume is

$$
u=U / A L=\sigma^{2} / 2 E
$$

（for tension）

## FLUID MECHANICS

## DENSITY, SPECIFIC VOLUME, SPECIFIC WEIGHT, AND SPECIFIC GRAVITY

The definitions of density, specific volume, specific weight, and specific gravity follow:

$$
\begin{array}{ll}
\rho=\operatorname{limit}_{\Delta V \rightarrow 0} & \Delta m / \Delta V \\
\gamma=\operatorname{limit}_{\Delta V \rightarrow 0} & \Delta W / \Delta V \\
\gamma=\operatorname{limit}_{\Delta V \rightarrow 0} & g \cdot \Delta m / \Delta V=\rho g
\end{array}
$$

also $S G=\gamma / \gamma_{w}=\rho / \rho_{w}$, where
$\rho=$ density (also mass density),
$\Delta m=$ mass of infinitesimal volume,
$\Delta V=$ volume of infinitesimal object considered,
$\gamma=$ specific weight,
$\Delta W=$ weight of an infinitesimal volume,
$S G=$ specific gravity, and
$\rho_{w}=$ mass density of water at standard conditions $=1,000 \mathrm{~kg} / \mathrm{m}^{3}\left(62.43 \mathrm{lbm} / \mathrm{ft}^{3}\right)$.

## STRESS, PRESSURE, AND VISCOSITY

Stress is defined as

$$
\tau(P)=\operatorname{limit}_{\Delta A \rightarrow 0} \quad \Delta F / \Delta A, \text { where }
$$

$\tau(P)=$ surface stress vector at point $P$,
$\Delta F=$ force acting on infinitesimal area $\Delta A$, and
$\Delta A=$ infinitesimal area at point $P$.

$$
\tau_{n}=-p
$$

$\tau_{t}=\mu(d v / d y) \quad$ (one-dimensional; i.e., $y$ ), where
$\tau_{n}$ and $\tau_{t}=$ the normal and tangential stress components at point $P$,
$p=$ the pressure at point $P$,
$\mu=$ absolute dynamic viscosity of the fluid
$\mathrm{N} \cdot \mathrm{s} / \mathrm{m}^{2}[\mathrm{lbm} /(\mathrm{ft}-\mathrm{sec})]$,
$d \mathrm{v}=$ velocity at boundary condition, and
$d y=$ normal distance, measured from boundary.
$v=\mu / \rho$, where
$v=$ kinematic viscosity; $\mathrm{m}^{2} / \mathrm{s}\left(\mathrm{ft}^{2} / \mathrm{sec}\right)$.
For a thin Newtonian fluid film and a linear velocity profile,

$$
v(y)=V y / \delta ; d v / d y=V / \delta, \text { where }
$$

$V=$ velocity of plate on film and
$\delta=$ thickness of fluid film.
For a power law (non-Newtonian) fluid

$$
\tau_{t}=K(d v / d y)^{n} \text {, where }
$$

$K=$ consistency index, and
$n=$ power law index.

$$
n<1 \equiv \text { pseudo plastic }
$$

$$
n>1 \equiv \text { dilatant }
$$

SURFACE TENSION AND CAPILLARITY
Surface tension $\sigma$ is the force per unit contact length

$$
\sigma=F / L, \text { where }
$$

$\sigma=$ surface tension, force/ength,
$F=$ surface force at the interface, and
$L=$ length of interface.
The capillary rise $h$ is approximated by

$$
h=4 \sigma \cos \beta /(\gamma d) \text {, where }
$$

$h=$ the height of the liquid in the vertical tube,
$\sigma=$ the surface tension,
$\beta=$ the angle made by the liquid with the wetted tube wall,
$\gamma=$ specific weight of the liquid, and
$d=$ the diameter or the capillary tube.

## THE PRESSURE FIELD IN A STATIC LIQUID AND MANOMETRY

- 

The difference in pressure between two different points is

$$
p_{2}-p_{1}=-\gamma\left(z_{2}-z_{1}\right)=-\gamma h
$$

- Bober, W. \& R.A. Kenyon, Fluid Mechanics, Copyright © 1980 by John Wiley \& Sons, Inc. Diagrams reprinted by permission of William Bober \& Richard A. Kenyon.

For a simple manometer,

$$
p_{o}=p_{2}+\gamma_{2} h_{2}-\gamma_{1} h_{1}
$$

Absolute pressure $=$ atmospheric pressure + gage pressure reading

Absolute pressure $=$ atmospheric pressure - vacuum gage pressure reading

Another device that works on the same principle as the manometer is the simple barometer.

$$
p_{\mathrm{atm}}=p_{A}=p_{v}+\gamma h=p_{B}+\gamma h
$$

- 

$p_{v}=$ vapor pressure of the barometer fluid

## FORCES ON SUBMERGED SURFACES AND THE CENTER OF PRESSURE

- 

Forces on a submerged plane wall. (a) Submerged plane surface. (b) Pressure distribution.
The pressure on a point at a distance $Z^{\prime}$ below the surface is

$$
p=p_{\mathrm{o}}+\gamma Z^{\prime}, \text { for } Z^{\prime} \geq 0
$$

If the tank were open to the atmosphere, the effects of $p_{0}$ could be ignored.

The coordinates of the center of pressure $C P$ are
$y^{*}=\left(\gamma I_{y_{c} z_{c}} \sin \alpha\right) /\left(p_{c} A\right)$ and
$z^{*}=\left(\gamma I_{y_{c}} \sin \alpha\right) /\left(p_{c} A\right)$, where
$y^{*}=$ the $y$-distance from the centroid $(C)$ of area $(A)$ to the center of pressure,
$z^{*}=$ the $z$-distance from the centroid $(C)$ of area $(A)$ to the center of pressure,
$I_{y_{c}}$ and $I_{y_{c} z_{c}}=$ the moment and product of inertia of the area,
$p_{c}=$ the pressure at the centroid of area $(A)$, and
$Z_{c}=$ the slant distance from the water surface to the centroid $(C)$ of area $(A)$.

If the free surface is open to the atmosphere, then
$p_{\mathrm{o}}=0$ and $p_{c}=\gamma Z_{c} \sin \alpha$.

$$
y^{*}=I_{y_{c} z_{c}} /\left(A Z_{c}\right) \quad \text { and } \quad z^{*}=I_{y_{c}} /\left(A Z_{c}\right)
$$

The force on the plate can be computed as

$$
\boldsymbol{F}=\left[p_{1} A_{v}+\left(p_{2}-p_{1}\right) A_{v} / 2\right] \mathbf{i}+V_{f} \gamma_{f} \mathbf{j}, \text { where }
$$

$\boldsymbol{F}=$ force on the plate,
$p_{1}=$ pressure at the top edge of the plate area,
$p_{2}=$ pressure at the bottom edge of the plate area,
$A_{v}=$ vertical projection of the plate area,
$V_{f}=$ volume of column of fluid above plate, and
$\gamma_{f}=$ specific weight of the fluid.

## ARCHIMEDES PRINCIPLE AND BUOYANCY

1. The buoyant force exerted on a submerged or floating body is equal to the weight of the fluid displaced by the body.
2. A floating body displaces a weight of fluid equal to its own weight; i.e., a floating body is in equilibrium.
The center of buoyancy is located at the centroid of the submerged portion of the body.
In the case of a body lying at the interface of two immiscible fluids, the buoyant force equals the sum of the weights of the fluids displaced by the body.

## ONE-DIMENSIONAL FLOWS

The Continuity Equation So long as the flow $Q$ is continuous, the continuity equation, as applied to onedimensional flows, states that the flow passing two points (1 and 2) in a stream is equal at each point, $A_{1} V_{1}=A_{2} V_{2}$.

$$
\begin{aligned}
& Q=A V \\
& \dot{m}=\rho Q=\rho A V, \text { where }
\end{aligned}
$$

$Q=$ volumetric flow rate,
$\dot{m}=$ mass flow rate,

- Bober, W. \& R.A. Kenyon, Fluid Mechanics, Copyright © 1980 by John Wiley \& Sons, Inc. Diagrams reprinted by permission of William Bober \& Richard A. Kenyon.
$A=$ cross section of area of flow,
$V=$ average flow velocity, and
$\rho=$ the fluid density.
For steady, one-dimensional flow, $\dot{m}$ is a constant. If, in addition, the density is constant, then $Q$ is constant.

The Field Equation is derived when the energy equation is applied to one-dimensional flows.
Assuming no friction losses and that no pump or turbine exists between sections 1 and 2 in the system,

$$
\frac{p_{2}}{\gamma}+\frac{V_{2}^{2}}{2 g}+z_{2}=\frac{p_{1}}{\gamma}+\frac{V_{1}^{2}}{2 g}+z_{1}, \text { where }
$$

$p_{1}, p_{2}=$ pressure at sections 1 and 2,
$V_{1}, V_{2}=$ average velocity of the fluid at the sections,
$z_{1}, z_{2}=$ the vertical distance from a datum to the sections (the potential energy),
$\gamma \quad=$ the specific weight of the fluid, and
$g \quad=$ the acceleration of gravity.

## FLOW OF A REAL FLUID

$$
\frac{p_{1}}{\gamma}+z_{1}+\frac{V_{1}^{2}}{2 g}=\frac{p_{2}}{\gamma}+z_{2}+\frac{V_{2}^{2}}{2 g}+h_{f}
$$

The pressure drop as fluid flows through a pipe of constant cross-section and which is held at a fixed elevation is

$$
h_{f}=\left(p_{1}-p_{2}\right) / \gamma, \text { where }
$$

$h_{f}=$ the head loss, considered a friction effect, and all remaining terms are defined above.

## Fluid Flow

The velocity distribution for laminar flow in circular tubes or between planes is
$v=v_{\text {max }}\left[1-\left(\frac{r}{R}\right)^{2}\right]$, where
$r=$ the distance ( m ) from the centerline,
$R=$ the radius (m) of the tube or half the distance between the parallel planes,
$v=$ the local velocity $(\mathrm{m} / \mathrm{s})$ at $r$, and
$v_{\max }=$ the velocity $(\mathrm{m} / \mathrm{s})$ at the centerline of the duct.
$v_{\max }=1.18 \mathrm{~V}$, for fully turbulent flow
( $\mathrm{Re}>10,000$ )
$v_{\max }=2 \mathrm{~V}$, for circular tubes in laminar flow and
$v_{\max }=1.5 \mathrm{~V}$, for parallel planes in laminar flow, where
$V=$ the average velocity $(\mathrm{m} / \mathrm{s})$ in the duct.
The shear stress distribution is

$$
\frac{\tau}{\tau_{w}}=\frac{r}{R}, \text { where }
$$

$\tau$ and $\tau_{w}$ are the shear stresses at radii $r$ and $R$ respectively.

The drag force $F_{D}$ on objects immersed in a large body of flowing fluid or objects moving through a stagnant fluid is
$F_{D}=\frac{C_{D} \rho V^{2} A}{2}$, where
$C_{D}=$ the drag coefficient (see page 46),
$V=$ the velocity $(\mathrm{m} / \mathrm{s})$ of the undisturbed fluid, and
$A=$ the projected area $\left(\mathrm{m}^{2}\right)$ of bluff objects such as spheres, ellipsoids, and disks and plates, cylinders, ellipses, and air foils with axes perpendicular to the flow.

## For flat plates placed parallel with the flow

$$
\begin{aligned}
& C_{D}=1.33 / \operatorname{Re}^{0.5}\left(10^{4}<\operatorname{Re}<5 \times 10^{5}\right) \\
& C_{D}=0.031 / \operatorname{Re}^{1 / 7}\left(10^{6}<\operatorname{Re}<10^{9}\right)
\end{aligned}
$$

The characteristic length in the Reynolds Number (Re) is the length of the plate parallel with the flow. For bluff objects, the characteristic length is the largest linear dimension (diameter of cylinder, sphere, disk, etc.) which is perpendicular to the flow.

## Reynolds Number

$$
\begin{aligned}
& \operatorname{Re}=V D \rho / \mu=V D / v \\
& \operatorname{Re}^{\prime}=\frac{V^{(2-n)} D^{n} \rho}{K\left(\frac{3 n+1}{4 n}\right)^{n} 8^{(n-1)}}, \text { where }
\end{aligned}
$$

$\rho=$ the mass density,
$D=$ the diameter of the pipe or dimension of the fluid streamline,
$\mu=$ the dynamic viscosity,
$v=$ the kinematic viscosity,
$\operatorname{Re}=$ the Reynolds number (Newtonian fluid),
$\mathrm{Re}^{\prime}=$ the Reynolds number (Power law fluid), and
$K$ and $n$ are defined on page 38 .
The critical Reynolds number $(\mathrm{Re})_{c}$ is defined to be the minimum Reynolds number at which a flow will turn turbulent.

## Hydraulic Gradient (Grade Line)

The hydraulic gradient (grade line) is defined as an imaginary line above a pipe so that the vertical distance from the pipe axis to the line represents the pressure head at that point. If a row of piezometers were placed at intervals along the pipe, the grade line would join the water levels in the piezometer water columns.

## Energy Line (Bernoulli Equation)

The Bernoulli equation states that the sum of the pressure, velocity, and elevation heads is constant. The energy line is this sum or the "total head line" above a horizontal datum.

The difference between the hydraulic grade line and the energy line is the $V^{2} / 2 g$ term.

## STEADY, INCOMPRESSIBLE FLOW IN CONDUITS AND PIPES

The energy equation for incompressible flow is

$$
\frac{p_{1}}{\gamma}+z_{1}+\frac{V_{1}^{2}}{2 g}=\frac{p_{2}}{\gamma}+z_{2}+\frac{V_{2}^{2}}{2 g}+h_{f}
$$

If the cross-sectional area and the elevation of the pipe are the same at both sections (1 and 2), then $z_{1}=z_{2}$ and $V_{1}=V_{2}$. The pressure drop $p_{1}-p_{2}$ is given by the following:

$$
p_{1}-p_{2}=\psi_{f}
$$

The Darcy equation is

$$
h_{f}=f \frac{L}{D} \frac{V^{2}}{2 g}, \text { where }
$$

$f=\mathrm{f}(\operatorname{Re}, e / D)$, the friction factor,
$D=$ diameter of the pipe,
$L=$ length over which the pressure drop occurs,
$e=$ roughness factor for the pipe, and all other symbols are defined as before.
A chart that gives $f$ versus Re for various values of $e / \mathrm{D}$, known as a Moody or Stanton diagram, is available at the end of this section on page 45 .

## Friction Factor for Laminar Flow

The equation for $Q$ in terms of the pressure drop $\Delta p_{f}$ is the Hagen-Poiseuille equation. This relation is valid only for flow in the laminar region.

$$
Q=\frac{\pi R^{4} \Delta p_{f}}{8 \mu L}=\frac{\pi D^{4} \Delta p_{f}}{128 \mu L}
$$

## Flow in Noncircular Conduits

Analysis of flow in conduits having a noncircular cross section uses the hydraulic diameter $D_{\mathrm{H}}$, or the hydraulic radius $R_{H}$, as follows

$$
R_{H}=\frac{\text { cross }- \text { sectional area }}{\text { wetted perimeter }}=\frac{D_{H}}{4}
$$

## Minor Losses in Pipe Fittings, Contractions, and Expansions

Head losses also occur as the fluid flows through pipe fittings (i.e., elbows, valves, couplings, etc.) and sudden pipe contractions and expansions.

$$
\begin{aligned}
& \frac{p_{1}}{\gamma}+z_{1}+\frac{V_{1}^{2}}{2 g}=\frac{p_{2}}{\gamma}+z_{2}+\frac{V_{2}^{2}}{2 g}+h_{f}+h_{f, \text { fitting }}, \text { where } \\
& h_{f, \text { fitting }}=C \frac{V^{2}}{2 g}
\end{aligned}
$$

Specific fittings have characteristic values of $C$, which will be provided in the problem statement. A generally accepted nominal value for head loss in well-streamlined gradual contractions is

$$
h_{f, \text { fitting }}=0.04 V^{2} / 2 g
$$

The head loss at either an entrance or exit of a pipe from or to a reservoir is also given by the $h_{f \text {, fitting }}$ equation. Values for $C$ for various cases are shown as follows.

## PUMP POWER EQUATION

$\dot{W}=Q \gamma h / \eta$, where
$Q=$ quantity of flow ( $\mathrm{m}^{3} / \mathrm{s}$ or cfs ),
$h=$ head ( m or ft ) the fluid has to be lifted,
$\eta=$ efficiency, and
$\dot{W}=$ power (watts or $\mathrm{ft}-\mathrm{lbf} / \mathrm{sec}$ ).

## THE IMPULSE-MOMENTUM PRINCIPLE

The resultant force in a given direction acting on the fluid equals the rate of change of momentum of the fluid.

$$
\Sigma \boldsymbol{F}=Q_{2} \rho_{2} \boldsymbol{V}_{2}-Q_{1} \rho_{1} \boldsymbol{V}_{1} \text {, where }
$$

$\Sigma \boldsymbol{F}=$ the resultant of all external forces acting on the control volume,
$Q_{1} \rho_{1} V_{1}=$ the rate of momentum of the fluid flow entering the control volume in the same direction of the force, and
$Q_{2} \rho_{2} V_{2}=$ the rate of momentum of the fluid flow leaving the control volume in the same direction of the force.

## Pipe Bends, Enlargements, and Contractions

The force exerted by a flowing fluid on a bend, enlargement, or contraction in a pipe line may be computed using the impulse-momentum principle.

$$
\begin{aligned}
& p_{1} A_{1}-p_{2} A_{2} \cos \alpha-F_{x}=Q \rho\left(V_{2} \cos \alpha-V_{1}\right) \\
& F_{y}-W-p_{2} A_{2} \sin \alpha=Q \rho\left(V_{2} \sin \alpha-0\right), \text { where }
\end{aligned}
$$

$\boldsymbol{F}=$ the force exerted by the bend on the fluid (the force exerted by the fluid on the bend is equal in magnitude and opposite in sign), $F_{x}$ and $F_{y}$ are the $x$-component and $y$-component of the force,

[^2]$p=$ the internal pressure in the pipe line,
$A=$ the cross-sectional area of the pipe line,
$W=$ the weight of the fluid,
$V=$ the velocity of the fluid flow,
$\alpha=$ the angle the pipe bend makes with the horizontal,
$\rho=$ the density of the fluid, and
$Q=$ the quantity of fluid flow.

## Jet Propulsion

$$
F=Q \rho\left(V_{2}-0\right)
$$

$$
F=2 \gamma h A_{2} \text {, where }
$$

$F=$ the propulsive force,
$\gamma=$ the specific weight of the fluid,
$h=$ the height of the fluid above the outlet,
$A_{2}=$ the area of the nozzle tip,
$Q=A_{2} \sqrt{2 g h}$, and
$V_{2}=\sqrt{2 g h}$.

## Deflectors and Blades

Fixed Blade
-

$$
\begin{aligned}
-F_{x} & =Q \rho\left(V_{2} \cos \alpha-V_{1}\right) \\
F_{y} & =Q \rho\left(V_{2} \sin \alpha-0\right)
\end{aligned}
$$

## Moving Blade

$$
\begin{aligned}
-F_{x}= & Q \rho\left(V_{2 x}-V_{1 x}\right) \\
& =-Q \rho\left(V_{1}-v\right)(1-\cos \alpha) \\
F_{y}= & Q \rho\left(V_{2 y}-V_{1 y}\right) \\
& =+Q \rho\left(V_{1}-v\right) \sin \alpha, \text { where }
\end{aligned}
$$

$v=$ the velocity of the blade.

## Impulse Turbine

- 

$$
\dot{W}=Q \rho\left(V_{1}-v\right)(1-\cos \alpha) v, \text { where }
$$

$\dot{W}=$ power of the turbine.

$$
\dot{W}_{\max }=Q \rho\left(V_{1}^{2} / 4\right)(1-\cos \alpha)
$$

When $\alpha=180^{\circ}$,

$$
\dot{W}_{\max }=\left(Q \rho V_{1}^{2}\right) / 2=\left(Q \gamma V_{1}^{2}\right) / 2 g
$$

## MULTIPATH PIPELINE PROBLEMS

The same head loss occurs in each branch as in the combination of the two. The following equations may be solved simultaneously for $V_{A}$ and $V_{B}$ :

$$
\begin{aligned}
& h_{L}=f_{A} \frac{l_{A}}{D_{A}} \frac{V_{A}^{2}}{2 g}=f_{B} \frac{l_{B}}{D_{B}} \frac{V_{B}^{2}}{2 g} \\
& \left(\pi D^{2} / 4\right) V=\left(\pi D_{A}^{2} / 4\right) V_{A}+\left(\pi D_{B}^{2} / 4\right) V_{B}
\end{aligned}
$$

The flow $Q$ can be divided into $Q_{A}$ and $Q_{B}$ when the pipe characteristics are known.

## OPEN-CHANNEL FLOW AND/OR PIPE FLOW

Manning's Equation

|  | $V=(\mathrm{k} / \mathrm{n}) R^{2 / 3} S^{1 / 2}$, where |
| ---: | :--- |
| $\mathrm{k}=$ | 1 for SI units, |
| $\mathrm{k}=$ | 1.486 for USCS units,, |
| $V=$ | velocity $(\mathrm{m} / \mathrm{s}, \mathrm{ft} / \mathrm{sec})$, |
| $n=$ | roughness coefficient, |
| $R=$ | hydraulic radius ( $\mathrm{m}, \mathrm{ft})$, and |
| $S=$ | slope of energy grade line $(\mathrm{m} / \mathrm{m}, \mathrm{ft} / \mathrm{ft})$. |

## Hazen-Williams Equation

$V=\mathrm{k}_{1} C R^{0.63} S^{0.54}$, where
$C=$ roughness coefficient,
$\mathrm{k}_{1}=0.849$ for SI units, and
$\mathrm{k}_{1}=1.318$ for USCS units.
Other terms defined as above.

## MACH NUMBER

The speed of sound $c$ in an ideal gas is given by

$$
c=\sqrt{k R T} \text {, where }
$$

$k=c_{P} / c_{v}$.
This shows that the acoustic velocity in an ideal gas depends only on its temperature.
The mach number Ma is a ratio of the fluid velocity $V$ to the speed of sound:

$$
\mathrm{Ma}=V / c
$$

## FLUID MEASUREMENTS

The Pitot Tube - From the stagnation pressure equation for an incompressible fluid,

$$
V=\sqrt{(2 / \rho)\left(p_{o}-p_{s}\right)}=\sqrt{2 g\left(p_{o}-p_{s}\right) / \gamma} \text {, where }
$$

$V=$ the velocity of the fluid,
$p_{0}=$ the stagnation pressure, and
$p_{s}=$ the static pressure of the fluid at the elevation where the measurement is taken.
-

For a compressible fluid, use the above incompressible fluid equation if the mach number $\leq 0.3$.

## Venturi Meters

$Q=\frac{C_{v} A_{2}}{\sqrt{1-\left(A_{2} / A_{1}\right)^{2}}} \sqrt{2 g\left(\frac{p_{1}}{\gamma}+z_{1}-\frac{p_{2}}{\gamma}-z_{2}\right)}$, where
$C_{v}=$ the coefficient of velocity.
The above equation is for incompressible fluids.

Orifices The cross-sectional area at the vena contracta $A_{2}$ is characterized by a coefficient of contraction $C_{c}$ and given by $C_{c} A$.
-

where $C$, the coefficient of the meter, is given by

$$
C=\frac{C_{v} C_{c}}{\sqrt{1-C_{c}^{2}\left(A / A_{1}\right)^{2}}}
$$

- 

| ORIFICES AND THEIR NOMINAL COEFFICIENTS |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | SHARP <br> EDGED | ROUNDED | SHORT TUBE | BORDA |
|  |  |  |  |  |
| C | 0.61 | 0.98 | 0.80 | 0.51 |
| $\mathrm{C}_{\mathrm{c}}$ | 0.62 | 1.00 | 1.00 | 0.52 |
| $\mathrm{C}_{\mathrm{v}}$ | 0.98 | 0.98 | 0.80 | 0.98 |

Submerged Orifice operating under steady-flow conditions:
-

in which the product of $C_{c}$ and $C_{v}$ is defined as the coefficient of discharge of the orifice.

[^3]
## Orifice Discharging Freely Into Atmosphere

- 

$$
Q=C A \sqrt{2 g h}
$$

in which $h$ is measured from the liquid surface to the centroid of the orifice opening.

## DIMENSIONAL HOMOGENEITY AND DIMENSIONAL ANALYSIS

Equations that are in a form that do not depend on the fundamental units of measurement are called dimensionally homogeneous equations. A special form of the dimensionally homogeneous equation is one that involves only dimensionless groups of terms.

Buckingham's Theorem: The number of independent dimensionless groups that may be employed to describe a phenomenon known to involve $n$ variables is equal to the number ( $n-\overline{\mathrm{r}}$ ), where $\overline{\mathrm{r}}$ is the number of basic dimensions (i.e., $M, L, T$ ) needed to express the variables dimensionally.

## SIMILITUDE

In order to use a model to simulate the conditions of the prototype, the model must be geometrically, kinematically, and dynamically similar to the prototype system.
To obtain dynamic similarity between two flow pictures, all independent force ratios that can be written must be the same in both the model and the prototype. Thus, dynamic similarity between two flow pictures (when all possible forces are acting) is expressed in the five simultaneous equations below.

$$
\begin{aligned}
& {\left[\frac{F_{I}}{F_{p}}\right]_{p}=\left[\frac{F_{I}}{F_{p}}\right]_{m}=\left[\frac{\rho V^{2}}{p}\right]_{p}=\left[\frac{\rho V^{2}}{p}\right]_{m}} \\
& {\left[\frac{F_{I}}{F_{V}}\right]_{p}=\left[\frac{F_{I}}{F_{V}}\right]_{m}=\left[\frac{V l \rho}{\mu}\right]_{p}=\left[\frac{V l \rho}{\mu}\right]_{m}=[\mathrm{Re}]_{p}=[\mathrm{Re}]_{m}} \\
& {\left[\frac{F_{I}}{F_{G}}\right]_{p}=\left[\frac{F_{I}}{F_{G}}\right]_{m}=\left[\frac{V^{2}}{\lg }\right]_{p}=\left[\frac{V^{2}}{\mathrm{lg}}\right]_{m}=[\mathrm{Fr}]_{p}=[\mathrm{Fr}]_{m}} \\
& {\left[\frac{F_{I}}{F_{E}}\right]_{p}=\left[\frac{F_{I}}{F_{E}}\right]_{m}=\left[\frac{\rho V^{2}}{E_{v}}\right]_{p}=\left[\frac{\rho V^{2}}{E_{v}}\right]_{m}=[\mathrm{Ca}]_{p}=[\mathrm{Ca}]_{m}} \\
& {\left[\frac{F_{I}}{F_{T}}\right]_{p}=\left[\frac{F_{I}}{F_{T}}\right]_{m}=\left[\frac{\rho l V^{2}}{\sigma}\right]_{p}=\left[\frac{\rho l V^{2}}{\sigma}\right]_{m}=[\mathrm{We}]_{p}=[\mathrm{We}]_{m}}
\end{aligned}
$$

where
the subscripts $p$ and $m$ stand for prototype and model respectively, and
$F_{I}=$ inertia force,
$F_{P}=$ pressure force,
$F_{V}=$ viscous force,
$F_{G}=$ gravity force,
$F_{E}=$ elastic force,
$F_{T}=$ surface tension force,
$\operatorname{Re}=$ Reynolds number,
$\mathrm{We}=$ Weber number,
$\mathrm{Ca}=$ Cauchy number,
$\mathrm{Fr}=$ Froude number,
$l=$ characteristic length,
$V=$ velocity,
$\rho=$ density,
$\sigma=$ surface tension,
$E_{v}=$ bulk modulus,
$\mu=$ dynamic viscosity,
$p=$ pressure, and
$g=$ acceleration of gravity.

$$
\operatorname{Re}=\frac{V D \rho}{\mu}=\frac{V D}{v}
$$

## PROPERTIES OF WATER ${ }^{\text {f }}$

## THERMODYNAMICS

## PROPERTIES OF SINGLE-COMPONENT SYSTEMS

## Nomenclature

1. Intensive properties are independent of mass.
2. Extensive properties are proportional to mass.
3. Specific properties are lower case (extensive/mass).

## State Functions (properties)

Absolute Pressure, $p$

$$
\left(\mathrm{lbf} / \mathrm{in}^{2} \text { or } \mathrm{Pa}\right)
$$

Absolute Temperature, $T$
( ${ }^{\circ} \mathrm{R}$ or K )
$\left(\mathrm{ft}^{3} / \mathrm{lbm}\right.$ or $\left.\mathrm{m}^{3} / \mathrm{kg}\right)$
Specific Volume, v
Internal Energy, $u$
Enthalpy, $h=u+P v$ (same units as $u$ )

Entropy, $s$
[in Btu/(lbm- $\left.{ }^{\circ} \mathrm{R}\right)$ or $\mathrm{kJ} /(\mathrm{kg} \cdot \mathrm{K})$ ]
Gibbs Free Energy, $g=h-T s$ (same units as $u$ )
Helmholz Free Energy, $a=u-T s$ (same units as $u$ )
Heat Capacity at Constant Pressure, $c_{p}=\left(\frac{\partial h}{\partial T}\right)_{P}$
Heat Capacity at Constant Volume, $c_{v}=\left(\frac{\partial u}{\partial T}\right)_{v}$
Quality $x$ (applies to liquid-vapor systems at saturation) is defined as the mass fraction of the vapor phase:

$$
x=m_{g} /\left(m_{g}+m_{f}\right), \text { where }
$$

$m_{g}=$ mass of vapor, and
$m_{f}=$ mass of liquid.
Specific volume of a two-phase system can be written:
$v=x v_{g}+(1-x) v_{f} \quad$ or $\quad v=x v_{f g}+v_{f}$, where
$v_{f}=$ specific volume of saturated liquid,
$v_{g}=$ specific volume of saturated vapor, and
$v_{f g}=$ specific volume change upon vaporization.

$$
=v_{g}-v_{f}
$$

Similar expressions exist for $u, h$, and $s$ :

$$
\begin{aligned}
u & =x u_{g}+(1-x) u_{f} \\
h & =x h_{g}+(1-x) h_{f} \\
s & =x s_{g}+(1-x) s_{f}
\end{aligned}
$$

For a simple substance, specification of any two intensive, independent properties is sufficient to fix all the rest.
For an ideal gas, $P v=R T$ or $P V=m R T$, and
$P_{1} v_{1} / T_{1}=P_{2} v_{2} / T_{2}$, where
$p=$ pressure,
$v=$ specific volume,
$m=$ mass of gas,
$R=$ gas constant, and
$T=$ temperature.
$R$ is specific to each gas but can be found from

$$
R=\frac{\bar{R}}{(\text { mol. wt. })}, \text { where }
$$

$\bar{R}=$ the universal gas constant
$=1,545 \mathrm{ft}-\mathrm{lbf} /\left(\mathrm{lbmol}-{ }^{\circ} \mathrm{R}\right)=8,314 \mathrm{~J} /(\mathrm{kmol} \cdot \mathrm{K})$.
For Ideal Gases, $c_{P}-c_{v}=R$
Also, for Ideal Gases:

$$
\left(\frac{\partial h}{\partial v}\right)_{T}=0 \quad\left(\frac{\partial u}{\partial v}\right)_{T}=0
$$

For cold air standard, heat capacities are assumed to be constant at their room temperature values. In that case, the following are true:

$$
\begin{aligned}
& \Delta u=c_{v} \Delta T ; \quad \Delta h=c_{P} \Delta T \\
& \Delta s=c_{P} \ln \left(T_{2} / T_{1}\right)-R \ln \left(P_{2} / P_{1}\right) ; \text { and } \\
& \Delta s=c_{v} \ln \left(T_{2} / T_{1}\right)+R \ln \left(v_{2} / v_{1}\right)
\end{aligned}
$$

For heat capacities that are temperature dependent, the value to be used in the above equations for $\Delta \mathrm{h}$ is known as the mean heat capacity $\left(\bar{c}_{p}\right)$ and is given by

$$
\bar{c}_{p}=\frac{\int_{T_{1}}^{T_{2}} c_{p} d T}{T_{2}-T_{1}}
$$

Also, for constant entropy processes:

$$
\begin{aligned}
& P_{1} v_{1}^{k}=P_{2} v_{2}^{k} ; \quad T_{1} P_{1}{ }^{(1-k) / k}=T_{2} P_{2}^{(1-k) / k} \\
& T_{1} v_{1}{ }^{(k-1)}=T_{2} v_{2}^{(k-1)}, \text { where } k=c_{p} / c_{v}
\end{aligned}
$$

## FIRST LAW OF THERMODYNAMICS

The First Law of Thermodynamics is a statement of conservation of energy in a thermodynamic system. The net energy crossing the system boundary is equal to the change in energy inside the system.

Heat $Q$ is energy transferred due to temperature difference and is considered positive if it is inward or added to the system.

## Closed Thermodynamic System

(no mass crosses boundary)

$$
Q-w=\Delta U+\Delta \mathrm{KE}+\Delta \mathrm{PE}
$$

where
$\triangle K E=$ change in kinetic energy, and
$\triangle P E=$ change in potential energy.
Energy can cross the boundary only in the form of heat or work. Work can be boundary work, $w_{\mathrm{b}}$, or other work forms (electrical work, etc.)
Work $w$ is considered positive if it is outward or work done by the system.
Reversible boundary work is given by $w_{\mathrm{b}}=\int P d v$.

## Special Cases of Closed Systems

Constant Pressure (Charles' Law):

$$
w_{b}=P \Delta v
$$

(ideal gas) $T / v=$ constant

## Constant Volume:

$$
w_{\mathrm{b}}=0
$$

(ideal gas) $T / P=$ constant
Isentropic (ideal gas),

$$
\begin{gathered}
P v^{k}=\text { constant: } \\
w=\left(P_{2} v_{2}-P_{1} v_{1}\right) /(1-k) \\
=R\left(T_{2}-T_{1}\right) /(1-k)
\end{gathered}
$$

Constant Temperature (Boyle's Law):
(ideal gas) $P v=$ constant

$$
w_{\mathrm{b}}=R T \ln \left(v_{2} / v_{1}\right)=R T \ln \left(P_{1} / P_{2}\right)
$$

Polytropic (ideal gas),

$$
P v^{n}=\text { constant: }
$$

$$
w=\left(P_{2} v_{2}-P_{1} v_{1}\right) /(1-n)
$$

## Open Thermodynamic System

(allowing mass to cross the boundary)
There is flow work (PV) done by mass entering the system. The reversible flow work is given by:

$$
w_{\mathrm{rev}}=-\int v d P+\Delta K E+\Delta P E
$$

First Law applies whether or not processes are reversible.
FIRST LAW (energy balance)

$$
\begin{gathered}
\Sigma \dot{m}\left[h_{i}+V_{i}^{2} / 2+g Z_{i}\right]-\Sigma \dot{m}\left[h_{e}+V_{e}^{2} / 2+g Z_{e}\right] \\
+\dot{Q}_{i n}-\dot{W}_{n e t}=d\left(m_{s} u_{s}\right) / d t, \text { where }
\end{gathered}
$$

$\dot{W}_{\text {net }}=$ rate of net or shaft work transfer,
$m_{s}=$ mass of fluid within the system,
$u_{s}=$ specific internal energy of system, and
$\dot{Q}=$ rate of heat transfer (neglecting kinetic and potential energy).

## Special Cases of Open Systems

Constant Volume:

$$
\begin{array}{r}
w_{\text {rev }}=-v\left(P_{2}-P_{1}\right) \\
w_{\text {rev }}=0
\end{array}
$$

Constant Pressure:
Constant Temperature:
(ideal gas) $P v=$ constant:

Isentropic (ideal gas):

$$
w_{\text {rev }}=R T \ln \left(v_{2} / v_{1}\right)=R T \ln \left(P_{1} / P_{2}\right)
$$

$$
P v^{k}=\text { constant: }
$$

$$
\begin{array}{r}
w_{\text {rev }}=k\left(P_{2} v_{2}-P_{1} v_{1}\right) /(1-k) \\
=k R\left(T_{2}-T_{1}\right) /(1-k) \\
w_{\text {rev }}=\frac{k}{k-1} R T_{1}\left[1-\left(\frac{P_{2}}{P_{1}}\right)^{(k-1) / k}\right]
\end{array}
$$

Polytropic:

$$
P v^{n}=\text { constant }
$$

$$
w_{\text {rev }}=n\left(P_{2} v_{2}-P_{1} v_{1}\right) /(1-n)
$$

## Steady-State Systems

The system does not change state with time. This assumption is valid for steady operation of turbines, pumps, compressors, throttling valves, nozzles, and heat exchangers, including boilers and condensers.

$$
\begin{array}{r}
\sum \dot{m}_{i}\left(h_{i}+V_{i}^{2} / 2+g Z_{i}\right)-\sum \dot{m}_{e}\left(h_{e}+V_{e}^{2} / 2+g Z_{e}\right) \\
+\dot{Q}_{i n}-\dot{W}_{\text {out }}=0 \text { and } \\
\sum \dot{m}_{i}=\sum \dot{m}_{e}
\end{array}
$$

where
$\dot{m}=$ mass flow rate (subscripts $i$ and $e$ refer to inlet and exit states of system),
$g=$ acceleration of gravity,
$Z=$ elevation,
$V=$ velocity, and
$\dot{w}=$ rate of work.

## Special Cases of Steady-Flow Energy Equation

Nozzles, Diffusers: Velocity terms are significant. No elevation change, no heat transfer, and no work. Single mass stream.

$$
h_{i}+V_{i}^{2} / 2=h_{e}+V_{e}^{2} / 2
$$

Efficiency (nozzle) $=\frac{V_{e}^{2}-V_{i}^{2}}{2\left(h_{i}-h_{e s}\right)}$, where

$$
h_{e s}=\text { enthalpy at isentropic exit state. }
$$

Turbines, Pumps, Compressors: Often considered adiabatic (no heat transfer). Velocity terms usually can be ignored. There are significant work terms and a single mass stream.

$$
\begin{gathered}
h_{i}=h_{e}+w \\
\text { Efficiency (turbine) }=\frac{h_{i}-h_{e}}{h_{i}-h_{e s}}
\end{gathered}
$$

Efficiency (compressor, pump) $=\frac{h_{e s}-h_{i}}{h_{e}-h_{i}}$
Throttling Valves and Throttling Processes: No work, no heat transfer, and single-mass stream. Velocity terms often insignificant.

$$
h_{i}=h_{e}
$$

Boilers, Condensers, Evaporators, One Side in a Heat Exchanger: Heat transfer terms are significant. For a singlemass stream, the following applies:

$$
h_{i}+q=h_{e}
$$

Heat Exchangers: No heat or work. Two separate flow rates $\dot{m}_{1}$ and $m_{2}$ :

$$
\dot{m}_{1}\left(h_{1 i}-h_{1 e}\right)=\dot{m}_{2}\left(h_{2 e}-h_{2 i}\right)
$$

## Mixers, Separators, Open or Closed Feedwater Heaters:

$$
\begin{aligned}
& \sum \dot{m}_{i} h_{i}=\sum \dot{m}_{e} h_{e} \text { and } \\
& \sum \dot{m}_{i}=\sum \dot{m}_{e}
\end{aligned}
$$

## BASIC CYCLES

Heat engines take in heat $Q_{H}$ at a high temperature $T_{H}$, produce a net amount of work $w$, and reject heat $Q_{L}$ at a low temperature $T_{L}$. The efficiency $\eta$ of a heat engine is given by:

$$
\eta=w / Q_{H}=\left(Q_{H}-Q_{L}\right) / Q_{H}
$$

The most efficient engine possible is the Carnot Cycle. Its efficiency is given by:
$\eta_{c}=\left(T_{H}-T_{L}\right) / T_{H}$, where
$T_{H}$ and $T_{L}=$ absolute temperatures (Kelvin or Rankine).
The following heat-engine cycles are plotted on $P-v$ and $T-s$ diagrams (see page 52):

Carnot, Otto, Rankine
Refrigeration Cycles are the reverse of heat-engine cycles. Heat is moved from low to high temperature requiring work $W$. Cycles can be used either for refrigeration or as heat pumps.
Coefficient of Performance (COP) is defined as:
$\mathrm{COP}=Q_{H} / W$ for heat pump, and as
$\mathrm{COP}=Q_{L} / W$ for refrigerators and air conditioners.
Upper limit of COP is based on reversed Carnot Cycle:
$\mathrm{COP}_{c}=T_{H} /\left(T_{H}-T_{L}\right)$ for heat pump and
$\mathrm{COP}_{c}=T_{L} /\left(T_{H}-T_{L}\right)$ for refrigeration.
1 ton refrigeration $=12,000 \mathrm{Btu} \mathrm{hr}=3,516 \mathrm{~W}$

## IDEAL GAS MIXTURES

$i=1,2, \ldots, n$ constituents. Each constituent is an ideal gas.
Mole Fraction: $N_{i}=$ number of moles of component $i$.

$$
x_{i}=N_{i} / N ; N=\Sigma N_{i} ; \Sigma x_{i}=1
$$

Mass Fraction: $y_{i}=m_{i} / m ; m=\Sigma m_{i} ; \Sigma y_{i}=1$
Molecular Weight: $M=m / N=\Sigma x_{i} M_{i}$
Gas Constant: $R=\bar{R} / M$
To convert mole fractions to mass fractions:

$$
y_{i}=\frac{x_{i} M_{i}}{\sum\left(x_{i} M_{i}\right)}
$$

To convert mass fractions to mole fractions:

$$
x_{i}=\frac{y_{i} / M_{i}}{\sum\left(y_{i} / M_{i}\right)}
$$

Partial Pressures $\quad p=\sum p_{i} ; p_{i}=\frac{m_{i} R_{i} T}{V}$
Partial Volumes $\quad V=\Sigma V_{i} ; V_{i}=\frac{m_{i} R_{i} T}{p}$, where
$p, V, T=$ the pressure, volume, and temperature of the mixture.
$x_{i}=p_{i} / p=V_{i} / V$

## Other Properties

$u=\Sigma\left(y_{i} u_{i}\right) ; h=\Sigma\left(y_{i} h_{i}\right) ; s=\Sigma\left(y_{i} s_{i}\right)$
$u_{i}$ and $h_{i}$ are evaluated at $T$, and
$s_{i}$ is evaluated at $T$ and $p_{i}$.

## PSYCHROMETRICS

We deal here with a mixture of dry air (subscript $a$ ) and water vapor (subscript $v$ ):

$$
p=p_{a}+p_{v}
$$

Specific Humidity (absolute humidity) $\omega$.

$$
\omega=m_{v} / m_{a} \text {, where }
$$

$m_{v}=$ mass of water vapor and
$m_{a}=$ mass of dry air.

$$
\omega=0.622 p_{v} / p_{a}=0.622 p_{v} /\left(p-p_{v}\right)
$$

Relative Humidity $\phi$ :

$$
\phi=m_{v} / m_{g}=p_{v} / p_{g}, \text { where }
$$

$m_{g}=$ mass of vapor at saturation, and
$p_{g}=$ saturation pressure at $T$.
Enthalpy $h: h=h_{a}+\omega h_{v}$
Dew-Point Temperature $T_{d p}$ :

$$
T_{d p}=T_{\text {sat }} \text { at } p_{g}=p_{v}
$$

Wet-bulb temperature $T_{w b}$ is the temperature indicated by a thermometer covered by a wick saturated with liquid water and in contact with moving air.
Humidity Volume: Volume of moist air/mass of dry air.

## Psychrometric Chart

A plot of specific humidity as a function of dry-bulb temperature plotted for a value of atmospheric pressure. (See chart at end of section.)

## PHASE RELATIONS

Clapeyron Equation for Phase Transitions:

$$
\left(\frac{d p}{d T}\right)_{s a t}=\frac{h_{f g}}{T v_{f g}}=\frac{s_{f g}}{v_{f g}} \text {, where }
$$

$h_{f g}=$ enthalpy change for phase transitions,
$v_{f g}=$ volume change,
$s_{f g}=$ entropy change,
$T=$ absolute temperature, and
$(d P / d T)_{\text {sat }}=$ slope of vapor-liquid saturation line.

## Gibbs Phase Rule

$P+F=C+2$, where
$P=$ number of phases making up a system,
$F=$ degrees of freedom, and
$C=$ number of components in a system.

## Gibbs Free Energy

Energy released or absorbed in a reaction occurring reversibly at constant pressure and temperature $\Delta G$.

## Helmholtz Free Energy

Energy released or absorbed in a reaction occurring reversibly at constant volume and temperature $\Delta A$.

## COMBUSTION PROCESSES

First, the combustion equation should be written and balanced. For example, for the stoichiometric combustion of methane in oxygen:

$$
\mathrm{CH}_{4}+2 \mathrm{O}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}
$$

## Combustion in Air

For each mole of oxygen, there will be 3.76 moles of nitrogen. For stoichiometric combustion of methane in air:
$\mathrm{CH}_{4}+2 \mathrm{O}_{2}+2(3.76) \mathrm{N}_{2} \rightarrow \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O}+7.52 \mathrm{~N}_{2}$

## Combustion in Excess Air

The excess oxygen appears as oxygen on the right side of the combustion equation.

## Incomplete Combustion

Some carbon is burned to create carbon monoxide (CO).
Air-Fuel Ratio $(A / F): A / F=\frac{\text { mass of air }}{\text { mass of fuel }}$
Stoichiometric (theoretical) air-fuel ratio is the air-fuel ratio calculated from the stoichiometric combustion equation.
Percent Theoretical Air $=\frac{(A / F)_{\text {actual }}}{(A / F)_{\text {stoichiometric }}} \times 100$
Percent Excess Air $=\frac{(A / F)_{\text {actual }}-(A / F)_{\text {stoichiometric }}}{(A / F)_{\text {stoichiometric }}} \times 100$

## SECOND LAW OF THERMODYNAMICS

Thermal Energy Reservoirs

$$
\Delta S_{\text {reservoir }}=Q / T_{\text {reservoir }}, \text { where }
$$

$Q$ is measured with respect to the reservoir.

## Kelvin-Planck Statement of Second Law

No heat engine can operate in a cycle while transferring heat with a single heat reservoir.
COROLLARY to Kelvin-Planck: No heat engine can have a higher efficiency than a Carnot cycle operating between the same reservoirs.

## Clausius' Statement of Second Law

No refrigeration or heat pump cycle can operate without a net work input.
COROLLARY: No refrigerator or heat pump can have a higher COP than a Carnot cycle refrigerator or heat pump.

## VAPOR-LIQUID MIXTURES

## Henry's Law at Constant Temperature

At equilibrium, the partial pressure of a gas is proportional to its concentration in a liquid. Henry's Law is valid for low concentrations; i.e., $x \approx 0$.

$$
p_{i}=p y_{i}=h x_{i} \text {, where }
$$

$h=$ Henry's Law constant,
$p_{i}=$ partial pressure of a gas in contact with a liquid,
$x_{i}=$ mol fraction of the gas in the liquid,
$y_{i}=$ mol fraction of the gas in the vapor, and
$p=$ total pressure.

## Raoult's Law for Vapor-Liquid Equilibrium

Valid for concentrations near 1; i.e., $x_{i} \approx 1$.

$$
p_{i}=x_{i} p_{i}^{*} \text {, where }
$$

$p_{i}=$ partial pressure of component $i$,
$x_{i}=$ mol fraction of component $i$ in the liquid, and
$p_{i}{ }^{*}=$ vapor pressure of pure component $i$ at the temperature of the mixture.

## ENTROPY

$$
\begin{aligned}
& d s=(1 / T) \delta Q_{\mathrm{rev}} \\
& s_{2}-s_{1}=\int_{1}^{2}(1 / T) \delta Q_{\mathrm{rev}}
\end{aligned}
$$

## Inequality of Clausius

$$
\begin{aligned}
& \oint(1 / T) \delta Q_{r e v} \leq 0 \\
& \int_{1}^{2}(1 / T) \delta Q \leq s_{2}-s_{1}
\end{aligned}
$$

## Isothermal, Reversible Process

$$
\Delta s=s_{2}-s_{1}=Q / T
$$

## Isentropic process

$$
\Delta s=0 ; d s=0
$$

A reversible adiabatic process is isentropic.
Adiabatic Process

$$
\delta Q=0 ; \Delta s \geq 0
$$

Increase of Entropy Principle

$$
\begin{aligned}
\Delta s_{\text {total }} & =\Delta s_{\text {system }}+\Delta s_{\text {surroundings }} \geq 0 \\
\Delta \dot{s}_{\text {total }} & =\sum \dot{m}_{\text {out }} s_{\text {out }}-\sum \dot{m}_{\text {in }} s_{\text {in }} \\
& \quad-\sum\left(\dot{Q}_{\text {external }} / T_{\text {external }}\right) \geq 0
\end{aligned}
$$

## Temperature-Entropy (T-s) Diagram

$Q_{\text {rev }}=\int_{1}^{2} T d s$

## Entropy Change for Solids and Liquids

$$
\begin{aligned}
& d s=c(d T / T) \\
& s_{2}-s_{1}=\int c(d T / T)=c_{\text {mean }} \ln \left(T_{2} / T_{1}\right),
\end{aligned}
$$

where $c$ equals the heat capacity of the solid or liquid.

## Irreversibility

$I=w_{\text {rev }}-w_{\text {actual }}$

## Closed-System Availability

(no chemical reactions)
$\phi=\left(u-u_{\mathrm{o}}\right)-T_{\mathrm{o}}\left(s-s_{\mathrm{o}}\right)+p_{\mathrm{o}}\left(v-v_{\mathrm{o}}\right)$
$w_{\text {reversible }}=\phi_{1}-\phi_{2}$
Open-System Availability
$\psi=\left(h-h_{\mathrm{o}}\right)-T_{\mathrm{o}}\left(s-s_{\mathrm{o}}\right)+V^{2} / 2+g z$
$w_{\text {reversible }}=\psi_{1}-\psi_{2}$

## Saturated Water - Temperature Table

## HEAT TRANSFER

There are three modes of heat transfer: conduction, convection, and radiation. Boiling and condensation are classified as convection.

## Conduction

Fourier's Law of Conduction

$$
\dot{Q}=-k A(d T / d x) ., \text { where }
$$

$\dot{Q}=$ rate of heat transfer.
Conduction Through a Plane Wall:

$$
\dot{Q}=-k A\left(T_{2}-T_{1}\right) / L, \text { where }
$$

$k=$ the thermal conductivity of the wall,
$A=$ the wall surface area,
$L=$ the wall thickness, and
$T_{1}, T_{2}=$ the temperature on the near side and far side of the wall respectively.
Thermal resistance of the wall is given by

$$
R=L /(k A)
$$

Resistances in series are added.

## Composite Walls:

$R_{1}=L_{1} /\left(k_{1} A\right)$, and
$R_{2}=L_{2} /\left(k_{2} A\right)$.
To Evaluate Surface or Intermediate Temperatures:

$$
T_{2}=T_{1}-\dot{Q} R_{1} ; T_{3}=T_{2}-\dot{Q} R_{2}
$$

Conduction through a cylindrical wall is given by

$$
\begin{aligned}
\dot{Q} & =\frac{2 \pi k L\left(T_{1}-T_{2}\right)}{\ln \left(r_{2} / r_{1}\right)} \\
R & =\frac{\ln \left(r_{2} / r_{1}\right)}{2 \pi k L}
\end{aligned}
$$

## Convection

Convection is determined using a convection coefficient (heat transfer coefficient) $h$.

$$
\dot{Q}=h A\left(T_{w}-T_{\infty}\right), \text { where }
$$

$A=$ the heat transfer area,
$T_{w}=$ work temperature, and
$T_{\infty}=$ bulk fluid temperature.
Resistance due to convection is given by

$$
R=1 /(h A)
$$

FINS: For a straight fin,

$$
\dot{Q}=\sqrt{\operatorname{hpkA_{c}}}\left(T_{b}-T_{\infty}\right) \tanh m L_{c}, \text { where }
$$

$h=$ heat transfer coefficient,
$p=$ exposed perimeter,
$k=$ thermal conductivity,
$A_{c}=$ cross-sectional area,
$T_{\mathrm{b}}=$ temperature at base of fin,
$T_{\infty}=$ fluid temperature,
$m=\sqrt{h p /\left(k A_{c}\right)}$, and
$L_{c}=L+A_{c} / p$, corrected length.

## Radiation

The radiation emitted by a body is given by

$$
\dot{Q}=\varepsilon \sigma A T^{4}, \text { where }
$$

$T=$ the absolute temperature ( K or ${ }^{\circ} \mathrm{R}$ ),
$\sigma=5.67 \times 10^{-8} \mathrm{~W} /\left(\mathrm{m}^{2} \cdot \mathrm{~K}^{4}\right)$

$$
\left[0.173 \times 10^{-8} \mathrm{Btu} /\left(\mathrm{hr}-\mathrm{ft}^{2}-{ }^{\circ} \mathrm{R}^{4}\right)\right]
$$

$\varepsilon \quad=$ the emissivity of the body, and
$A=$ the body surface area.
For a body (1) which is small compared to its surroundings (2)

$$
\dot{Q}_{12}=\varepsilon \sigma A\left(T_{1}^{4}-T_{2}^{4}\right), \text { where }
$$

$\dot{Q}_{12}=$ the net heat transfer rate from the body.

A black body is defined as one which absorbs all energy incident upon it. It also emits radiation at the maximum rate for a body of a particular size at a particular temperature. For such a body

$$
\alpha=\varepsilon=1, \text { where }
$$

$\alpha=$ the absorptivity (energy absorbed/incident energy).
A gray body is one for which $\alpha=\varepsilon$, where

$$
0<\alpha<1 ; 0<\varepsilon<1
$$

Real bodies are frequently approximated as gray bodies.
The net energy exchange by radiation between two black bodies, which see each other, is given by

$$
\dot{Q}_{12}=A_{1} F_{12} \sigma\left(T_{1}^{4}-T_{2}^{4}\right) \text {, where }
$$

$F_{12}=$ the shape factor (view factor, configuration factor); 0

$$
\leq F_{12} \leq 1 .
$$

For any body, $\alpha+\rho+\tau=1$, where
$\alpha=$ absorptivity,
$\rho=$ reflectivity (ratio of energy reflected to incident energy), and
$\tau=$ transmissivity (ratio of energy transmitted to incident energy).

For an opaque body, $\alpha+\rho=1$
For a gray body, $\quad \varepsilon+\rho=1$

## The following is applicable to the PM examination for mechanical and chemical engineers.

The overall heat-transfer coefficient for a shell-and-tube heat exchanger is
$\frac{1}{U A}=\frac{1}{h_{i} A_{i}}+\frac{R_{f i}}{A_{i}}+\frac{t}{k A_{\text {avg }}}+\frac{R_{f o}}{A_{o}}+\frac{1}{h_{o} A_{o}}$, where
$A=$ any convenient reference area $\left(\mathrm{m}^{2}\right)$,
$A_{\text {avg }}=$ average of inside and outside area (for thin-walled tubes) ( $\mathrm{m}^{2}$ ),
$A_{i}=$ inside area of tubes $\left(\mathrm{m}^{2}\right)$,
$A_{o}=$ outside area of tubes $\left(\mathrm{m}^{2}\right)$,
$h_{i}=$ heat-transfer coefficient for inside of tubes [W/(m².K)],
$h_{o}=$ heat-transfer coefficient for outside of tubes $\left[\mathrm{W} /\left(\mathrm{m}^{2} \cdot \mathrm{~K}\right)\right]$,
$k=$ thermal conductivity of tube material $[\mathrm{W} /(\mathrm{m} \cdot \mathrm{K})]$,
$R_{f i}=$ fouling factor for inside of tube $\left(\mathrm{m}^{2} \cdot \mathrm{~K} / \mathrm{W}\right)$,
$R_{f o}=$ fouling factor for outside of tube $\left(\mathrm{m}^{2} \cdot \mathrm{~K} / \mathrm{W}\right)$,
$t=$ tube-wall thickness (m), and
$U=$ overall heat-transfer coefficient based on area $A$ and the log mean temperature difference $\left[\mathrm{W} /\left(\mathrm{m}^{2} \cdot \mathrm{~K}\right)\right]$.

The log mean temperature difference (LMTD) for countercurrent flow in tubular heat exchangers is

$$
\Delta T_{l m}=\frac{\left(T_{H o}-T_{C i}\right)-\left(T_{H i}-T_{C o}\right)}{\ln \left(\frac{T_{H o}-T_{C i}}{T_{H i}-T_{C o}}\right)}
$$

The log mean temperature difference for concurrent (parallel) flow in tubular heat exchangers is

$$
\Delta T_{l m}=\frac{\left(T_{H o}-T_{C o}\right)-\left(T_{H i}-T_{C i}\right)}{\ln \left(\frac{T_{H o}-T_{C o}}{T_{H i}-T_{C i}}\right)} \text {, where }
$$

$\Delta T_{l m}=\log$ mean temperature difference (K),
$T_{H i}=$ inlet temperature of the hot fluid (K),
$T_{H o}=$ outlet temperature of the hot fluid (K),
$T_{C i}=$ inlet temperature of the cold fluid (K), and
$T_{C o}=$ outlet temperature of the cold fluid (K).
For individual heat-transfer coefficients of a fluid being heated or cooled in a tube, one pair of temperatures (either the hot or the cold) are the surface temperatures at the inlet and outlet of the tube.
Heat exchanger effectiveness $=$

$$
\begin{aligned}
& \frac{\text { actual heat transfer }}{\text { max possible heat transfer }}=\frac{\mathrm{q}}{\mathrm{q}_{\max }} \\
& \varepsilon=\frac{C_{H}\left(T_{H i}-T_{H o}\right)}{C_{\min }\left(T_{H i}-T_{C i}\right)} \\
& \varepsilon=\frac{C_{C}\left(T_{C o}-T_{C i}\right)}{C_{\min }\left(T_{H i}-T_{C i}\right)} \text { or }
\end{aligned}
$$

Where $C_{\text {min }}=$ smaller of $C_{c}$ or $C_{H}$ and $C=\dot{m} c_{p}$
Number of transfer units, $\mathrm{NTU}=\frac{U A}{C_{\text {min }}}$
At a cross-section in a tube where heat is being transferred

$$
\begin{aligned}
\frac{\dot{Q}}{A} & =h\left(T_{w}-T_{b}\right)=\left[k_{f}\left(\frac{d t}{d r}\right)_{w}\right]_{\text {fluid }} \\
& =\left[k_{m}\left(\frac{d t}{d r}\right)_{w}\right]_{\text {metal }}, \text { where }
\end{aligned}
$$

$\dot{Q} / A=$ local inward radial heat flux $\left(\mathrm{W} / \mathrm{m}^{2}\right)$,
$h=$ local heat-transfer coefficient $\left[\mathrm{W} /\left(\mathrm{m}^{2} \cdot \mathrm{~K}\right)\right]$,
$k_{f}=$ thermal conductivity of the fluid $[\mathrm{W} /(\mathrm{m} \cdot \mathrm{K})]$,
$k_{m} \quad=$ thermal conductivity of the tube metal [W/(m.K)],
$(d t / d r)_{w}=$ radial temperature gradient at the tube surface (K/m),
$T_{b} \quad=$ local bulk temperature of the fluid (K), and
$T_{w} \quad=$ local inside surface temperature of the tube (K).

Rate of Heat Transfer in a Tubular Heat Exchanger
For the equations below, the following definitions along with definitions previously supplied are required.
$\mathrm{D}=$ inside diameter
$\mathrm{Gz}=\operatorname{Graetz}$ number $[\operatorname{RePr}(D / L)]$,
$\mathrm{Nu}=$ Nusselt number $(h D / k)$,
$\operatorname{Pr}=$ Prandtl number $\left(c_{P} \mu / k\right)$,
$A=$ area upon which $U$ is based $\left(\mathrm{m}^{2}\right)$,
$F=$ configuration correction factor,
$g=$ acceleration of gravity $\left(9.81 \mathrm{~m} / \mathrm{s}^{2}\right)$,
$L=$ heated (or cooled) length of conduit or surface (m),
$\dot{Q}=$ inward rate of heat transfer (W),
$T_{s}=$ temperature of the surface (K),
$T_{s v}=$ temperature of saturated vapor (K), and
$\lambda=$ heat of vaporization $(\mathrm{J} / \mathrm{kg})$.

$$
\dot{Q}=U A F \Delta T_{l m}
$$

Heat-transfer for laminar flow ( $\operatorname{Re}<2,000$ ) in a closed conduit.

$$
\mathrm{Nu}=3.66+\frac{0.19 \mathrm{Gz}^{0.8}}{1+0.117 \mathrm{Gz}^{0.467}}
$$

Heat-transfer for turbulent flow $\left(\operatorname{Re}>10^{4}, \operatorname{Pr}>0.7\right)$ in a closed conduit (Sieder-Tate equation).

$$
\mathrm{Nu}=\frac{\mathrm{h}_{\mathrm{i}} \mathrm{D}}{\mathrm{k}_{\mathrm{f}}}=0.023 \mathrm{Re}^{0.8} \operatorname{Pr}^{1 / 3}\left(\mu_{b} / \mu_{w}\right)^{0.14} \text {, where }
$$

$\mu_{b}=\mu\left(T_{b}\right)$, and
$\mu_{w}=\mu\left(T_{w}\right)$, and $\operatorname{Re}$ and $\operatorname{Pr}$ are evaluated at $T_{b}$.
For non-circular ducts, use the equivalent diameter.
The equivalent diameter is defined as

$$
\mathrm{D}_{\mathrm{H}}=\frac{4(\text { cross }- \text { sectional area })}{\text { wetted perimeter }}
$$

For a circular annulus $\left(D_{o}>D_{i}\right)$ the equivalent diameter is

$$
\mathrm{D}_{\mathrm{H}}=\mathrm{D}_{\mathrm{o}}-\mathrm{D}_{\mathrm{i}}
$$

For liquid metals ( $0.003<\mathrm{Pr}<0.05$ ) flowing in closed conduits.
$\mathrm{Nu}=6.3+0.0167 \mathrm{Re}^{0.85} \mathrm{Pr}^{0.93}$ (constant heat flux)
$\mathrm{Nu}=7.0+0.025 \mathrm{Re}^{0.8} \mathrm{Pr}^{0.8}$ (constant wall temperature)
Heat-transfer coefficient for condensation of a pure vapor on a vertical surface.

$$
\frac{h L}{k}=0.943\left(\frac{L^{3} \rho^{2} g \lambda}{k \mu\left(T_{s v}-T_{s}\right)}\right)^{0.25}
$$

Properties other than $\lambda$ are for the liquid and are evaluated at the average between $T_{s v}$ and $T_{s}$.
For condensation outside horizontal tubes, change 0.943 to 0.73 and replace $L$ with the tube outside diameter.

## Heat Transfer to/from Bodies Immersed in a Large Body of Flowing Fluid

In all cases, evaluate fluid properties at average temperature between that of the body and that of the flowing fluid.

For flow parallel to a constant-temperature flat plate of length $L$ ( m )
$\mathrm{Nu}=0.648 \mathrm{Re}^{0.5} \mathrm{Pr}^{1 / 3}$
$\left(\operatorname{Re}<10^{5}\right)$
$\mathrm{Nu}=0.0366 \operatorname{Re}^{0.8} \mathrm{Pr}^{1 / 3}$
( $\mathrm{Re}>10^{5}$ )

Use the plate length in the evaluation of the Nusselt and Reynolds numbers.

For flow perpendicular to the axis of a constant-temperature circular cylinder
$\mathrm{Nu}=c \operatorname{Re}^{n} \operatorname{Pr}^{1 / 3}$
(values of $c$ and $n$ follow)
Use the cylinder diameter in the evaluation of the Nusselt and Reynolds numbers.

| $\boldsymbol{R e}$ | $\boldsymbol{n}$ | $\boldsymbol{c}$ |
| :---: | :---: | :---: |
| $1-4$ | 0.330 | 0.989 |
| $4-40$ | 0.385 | 0.911 |
| $40-4,000$ | 0.466 | 0.683 |
| $4,000-40,000$ | 0.618 | 0.193 |
| $40,000-250,000$ | 0.805 | 0.0266 |

For flow past a constant-temperature sphere. $\mathrm{Nu}=2.0+$ $0.60 \mathrm{Re}^{0.5} \mathrm{Pr}^{1 / 3}$
$(1<\operatorname{Re}<70,000,0.6<\operatorname{Pr}<400)$
Use the sphere diameter in the evaluation of the Nusselt and Reynolds numbers.

## Conductive Heat Transfer

Steady Conduction with Internal Energy Generation
For one-dimensional steady conduction, the equation is

$$
d^{2} T / d x^{2}+\dot{Q}_{g e n} / k=0, \text { where }
$$

$\dot{Q}_{\text {gen }}=$ the heat generation rate per unit volume, and
$k=$ the thermal conductivity.
For a plane wall:

$$
\begin{aligned}
& T(x)=\frac{\dot{Q}_{\mathrm{gen}} L^{2}}{2 \mathrm{k}}\left(1-\frac{x^{2}}{L^{2}}\right)+\left(\frac{T_{s 2}-T_{s 1}}{2}\right)\left(\frac{x}{L}\right)+\left(\frac{T_{s 1}+T_{s 2}}{2}\right) \\
& \quad \dot{Q}_{1}^{\prime \prime}+\dot{Q}_{2}^{\prime \prime}=2 \dot{Q}_{\mathrm{gen}} L, \text { where } \\
& \dot{Q}_{1}^{\prime \prime}=k(d T / d x)_{-L} \\
& \dot{Q}_{2}^{\prime \prime}=-k(d T / d x)_{L}
\end{aligned}
$$

For a long circular cylinder:

$\frac{1}{r} \frac{d}{d r}\left(r \frac{d T}{d r}\right)+\frac{\dot{Q}_{\mathrm{gen}}}{k}=0$
$T(r)=\frac{\dot{Q}_{\text {gen }} r_{0}^{2}}{4 k}\left(1-\frac{r^{2}}{r_{0}^{2}}\right)+T_{s}$
$\dot{Q}^{\prime}=\pi r_{0}^{2} \dot{Q}_{\text {gen }}$, where
$\dot{Q}^{\prime}=$ the heat-transfer rate from the cylinder per unit length.

## Transient Conduction Using the Lumped Capacitance

Method

If the temperature may be considered uniform within the body at any time, the change of body temperature is given by

$$
\dot{Q}=h A_{s}\left(T-T_{\infty}\right)=-\rho c_{p} V(d T / d t)
$$

The temperature variation with time is
$T-T_{\infty}=\left(T_{i}-T_{\infty}\right) \mathrm{e}^{-\left(h A_{s} / p c_{p} V\right)_{t}}$
The total heat transferred up to time $t$ is
$Q_{\text {total }}=\rho c_{P} V\left(T_{i}-T\right)$, where
$\rho=$ density,
$V=$ volume,
$c_{P}=$ heat capacity,
$t=$ time,
$A_{s}=$ surface area of the body,
$T=$ temperature, and
$h=$ the heat-transfer coefficient.
The lumped capacitance method is valid if
Biot number $=\mathrm{Bi}=h V / k A_{s} \ll 1$

## Natural (Free) Convection

For free convection between a vertical flat plate (or a vertical cylinder of sufficiently large diameter) and a large body of stationary fluid,

$$
h=C(k / L) \mathrm{Ra}_{L}{ }^{n} \text {, where }
$$

$L=$ the length of the plate in the vertical direction,
$\operatorname{Ra}_{L}=\quad$ Rayleigh Number $=\frac{g \beta\left(T_{s}-T_{\infty}\right) L^{3}}{v^{2}} \operatorname{Pr}$,
$T_{s}=$ surface temperature,
$T_{\infty}=$ fluid temperature,
$\beta=$ coefficient of thermal expansion $\left(\frac{2}{T_{s}+T_{\infty}}\right.$ for an ideal gas where $T$ is absolute temperature), and
$v=$ kinematic viscosity.

| Range of $\mathbf{R a}_{\boldsymbol{L}}$ | $\boldsymbol{C}$ | $\boldsymbol{n}$ |
| :---: | :---: | :---: |
| $10^{4}-10^{9}$ | 0.59 | $1 / 4$ |
| $10^{9}-10^{13}$ | 0.10 | $1 / 3$ |

For free convection between a long horizontal cylinder and a large body of stationary fluid

$$
\begin{aligned}
& h=C(k / D) \operatorname{Ra}_{D}^{n}, \text { where } \\
\operatorname{Ra}_{D}= & \frac{g \beta\left(T_{s}-T_{\infty}\right) D^{3}}{v^{2}} \operatorname{Pr}
\end{aligned}
$$

| Range of Ra $\boldsymbol{D}_{\boldsymbol{D}}$ | $\boldsymbol{C}$ | $\boldsymbol{n}$ |
| :---: | :---: | :---: |
| $10^{-3}-10^{2}$ | 1.02 | 0.148 |
| $10^{2}-10^{4}$ | 0.850 | 0.188 |
| $10^{4}-10^{7}$ | 0.480 | 0.250 |
| $10^{7}-10^{12}$ | 0.125 | 0.333 |

## Radiation

## Two-Body Problem

Applicable to any two diffuse-gray surfaces that form an enclosure.

$$
\dot{Q}_{12}=\frac{\sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\frac{1-\varepsilon_{1}}{\varepsilon_{1} A_{1}}+\frac{1}{A_{1} F_{12}}+\frac{1-\varepsilon_{2}}{\varepsilon_{2} A_{2}}}
$$

Generalized Cases

## Radiation Shields

One-dimensional geometry with low-emissivity shield inserted between two parallel plates.

$\dot{Q}_{12}=\frac{\sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\frac{1-\varepsilon_{1}}{\varepsilon_{1} A_{1}}+\frac{1}{A_{1} F_{13}}+\frac{1-\varepsilon_{3,1}}{\varepsilon_{3,1} A_{3}}+\frac{1-\varepsilon_{3,2}}{\varepsilon_{3,2} A_{3}}+\frac{1}{A_{3} F_{32}}+\frac{1-\varepsilon_{2}}{\varepsilon_{2} A_{2}}}$

## Shape Factor Relations

Reciprocity relations:

$$
A_{i} F_{i j}=A_{j} F_{j i}
$$

Summation rule:

$$
\sum_{j=1}^{N} F_{i j}=1
$$

## Reradiating Surface

Reradiating surfaces are considered to be insulated, or adiabatic ( $\dot{Q}_{R}=0$ ).

$\dot{Q}_{12}=\frac{\sigma\left(T_{1}^{4}-T_{2}^{4}\right)}{\frac{1-\varepsilon_{1}}{\varepsilon_{1} A_{1}}+\frac{1}{A_{1} F_{12}+\left[\left(\frac{1}{A_{1} F_{1 R}}\right)+\left(\frac{1}{A_{2} F_{2 R}}\right)\right]^{-1}+\frac{1-\varepsilon_{2}}{\varepsilon_{2} A_{2}}}}$

## TRANSPORT PHENOMENA

MOMENTUM, HEAT, AND MASS TRANSFER ANALOGY
For the equations which apply to turbulent flow in circular tubes, the following definitions apply:
$\mathrm{Nu}=$ Nusselt Number $\left[\frac{h D}{k}\right]$
Pr $=$ Prandtl Number $\left(c_{P} \mu / k\right)$,
Re $=$ Reynolds Number ( $D V \rho / \mu$ ),
Sc $=$ Schmidt Number $\left[\mu /\left(\rho D_{m}\right)\right]$,
Sh $=$ Sherwood Number $\left(k_{m} D / D_{m}\right)$,
St $=$ Stanton Number $\left[h /\left(c_{p} G\right)\right]$,
$c_{m}=$ concentration $\left(\mathrm{mol} / \mathrm{m}^{3}\right)$,
$c_{P}=$ heat capacity of fluid [ $\left.\mathrm{J} /(\mathrm{kg} \cdot \mathrm{K})\right]$,
$D=$ tube inside diameter (m),
$D_{m}=$ diffusion coefficient $\left(\mathrm{m}^{2} / \mathrm{s}\right)$,
$\left(d c_{m} / d y\right)_{w}=$ concentration gradient at the wall $\left(\mathrm{mol} / \mathrm{m}^{4}\right)$,
$(d T / d y)_{w}=$ temperature gradient at the wall $(\mathrm{K} / \mathrm{m})$,
$(d v / d y)_{w}=$ velocity gradient at the wall $\left(\mathrm{s}^{-1}\right)$,
$f=$ Moody friction factor,
$G=$ mass velocity $\left[\mathrm{kg} /\left(\mathrm{m}^{2} \cdot \mathrm{~s}\right)\right]$,
$h=$ heat-transfer coefficient at the wall $\left[\mathrm{W} /\left(\mathrm{m}^{2} \cdot \mathrm{~K}\right)\right]$,
$k=$ thermal conductivity of fluid $[\mathrm{W} /(\mathrm{m} \cdot \mathrm{K})]$,
$k_{m}=$ mass-transfer coefficient (m/s),
$L=$ length over which pressure drop occurs (m),
$(N / A)_{w}=$ inward mass-transfer flux at the wall $\left[\mathrm{mol} /\left(\mathrm{m}^{2} \cdot \mathrm{~s}\right)\right]$,
$(\dot{Q} / A)_{w}=$ inward heat-transfer flux at the wall $\left(\mathrm{W} / \mathrm{m}^{2}\right)$,
$y=$ distance measured from inner wall toward centerline (m),
$\Delta c_{m}=$ concentration difference between wall and bulk fluid $\left(\mathrm{mol} / \mathrm{m}^{3}\right)$,
$\Delta T=$ temperature difference between wall and bulk fluid (K),
$\mu=$ absolute dynamic viscosity ( $\mathrm{N} \cdot \mathrm{s} / \mathrm{m}^{2}$ ), and
$\tau_{w}=$ shear stress (momentum flux) at the tube wall ( $\mathrm{N} / \mathrm{m}^{2}$ ).
Definitions already introduced also apply.

Rate of transfer as a function of gradients at the wall
Momentum Transfer:

$$
\tau_{w}=-\mu\left(\frac{d v}{d y}\right)_{w}=-\frac{f \rho V^{2}}{8}=\left(\frac{D}{4}\right)\left(-\frac{\Delta p}{L}\right)_{f}
$$

Heat Transfer:

$$
\left(\frac{\dot{Q}}{A}\right)_{w}=-k\left(\frac{d T}{d y}\right)_{w}
$$

Mass Transfer in Dilute Solutions:

$$
\left(\frac{N}{A}\right)_{w}=-D_{m}\left(\frac{d c_{m}}{d y}\right)_{w}
$$

## Rate of transfer in terms of coefficients

Momentum Transfer:

$$
\tau_{w}=\frac{f \rho V^{2}}{8}
$$

Heat Transfer:

$$
\left(\frac{\dot{Q}}{A}\right)_{w}=h \Delta T
$$

Mass Transfer:

$$
\left(\frac{N}{A}\right)_{w}=k_{m} \Delta c_{m}
$$

Use of friction factor $(f)$ to predict heat-transfer and masstransfer coefficients (turbulent flow)
Heat Transfer:

$$
j_{H}=\left(\frac{\mathrm{Nu}}{\operatorname{RePr}}\right) \operatorname{Pr}^{2 / 3}=\frac{f}{8}
$$

Mass Transfer:

$$
j_{M}=\left(\frac{\mathrm{Sh}}{\operatorname{ReSc}}\right) \mathrm{Sc}^{2 / 3}=\frac{f}{8}
$$

## CHEMISTRY

Avogadro's Number: The number of elementary particles in a mol of a substance.

$$
\begin{aligned}
& 1 \mathrm{~mol}=1 \text { gram-mole } \\
& 1 \mathrm{~mol}=6.02 \times 10^{23} \text { particles }
\end{aligned}
$$

A mol is defined as an amount of a substance that contains as many particles as 12 grams of ${ }^{12} \mathrm{C}$ (carbon 12). The elementary particles may be atoms, molecules, ions, or electrons.

## ACIDS AND BASES (aqueous solutions)

$$
\mathrm{pH}=\log _{10}\left(\frac{1}{\left[\mathrm{H}^{+}\right]}\right), \text {where }
$$

$\left[\mathrm{H}^{+}\right]=$molar concentration of hydrogen ion,
Acids have $\mathrm{pH}<7$.
Bases have $\mathrm{pH}>7$.

## ELECTROCHEMISTRY

Cathode - The electrode at which reduction occurs.
Anode - The electrode at which oxidation occurs.
Oxidation - The loss of electrons.
Reduction - The gaining of electrons.
Oxidizing Agent - A species that causes others to become oxidized.
Reducing Agent - A species that causes others to be reduced.
Cation - Positive ion
Anion - Negative ion

## DEFINITIONS

Molarity of Solutions - The number of gram moles of a substance dissolved in a liter of solution.
Molality of Solutions - The number of gram moles of a substance per 1,000 grams of solvent.
Normality of Solutions - The product of the molarity of a solution and the number of valences taking place in a reaction.
Equivalent Mass - The number of parts by mass of an element or compound which will combine with or replace directly or indirectly 1.008 parts by mass of hydrogen, 8.000 parts of oxygen, or the equivalent mass of any other element or compound. For all elements, the atomic mass is the product of the equivalent mass and the valence.
Molar Volume of an Ideal Gas [at $0^{\circ} \mathrm{C}\left(32^{\circ} \mathrm{F}\right)$ and 1 atm ( 14.7 psia ) $] ; 22.4 \mathrm{~L} /\left(\mathrm{g}\right.$ mole) $\left[359 \mathrm{ft}^{3} /(\mathrm{lb}\right.$ mole $\left.)\right]$.
Mole Fraction of a Substance - The ratio of the number of moles of a substance to the total moles present in a mixture of substances. Mixture may be a solid, a liquid solution, or a gas.

Equilibrium Constant of a Chemical Reaction

$$
\begin{aligned}
& a A+b B \rightleftarrows c C+d D \\
& K_{\mathrm{eq}}=\frac{[C]^{c}[D]^{d}}{[A]^{a}[B]^{b}}
\end{aligned}
$$

Le Chatelier's Principle for Chemical Equilibrium - When a stress (such as a change in concentration, pressure, or temperature) is applied to a system in equilibrium, the equilibrium shifts in such a way that tends to relieve the stress.
Heats of Reaction, Solution, Formation, and Combustion Chemical processes generally involve the absorption or evolution of heat. In an endothermic process, heat is absorbed (enthalpy change is positive). In an exothermic process, heat is evolved (enthalpy change is negative).
Solubility Product of a slightly soluble substance $A B$ :

$$
A_{m} B_{n} \rightarrow m A^{n+}+n B^{m-}
$$

Solubility Product Constant $=K_{\mathrm{SP}}=\left[A^{+}\right]^{m}[B]^{n}$
Metallic Elements - In general, metallic elements are distinguished from non-metallic elements by their luster, malleability, conductivity, and usual ability to form positive ions.
Non-Metallic Elements - In general, non-metallic elements are not malleable, have low electrical conductivity, and rarely form positive ions.
Faraday's Law - In the process of electrolytic changes, equal quantities of electricity charge or discharge equivalent quantities of ions at each electrode. One gram equivalent weight of matter is chemically altered at each electrode for 96,485 coulombs, or one Faraday, of electricity passed through the electrolyte.
A catalyst is a substance that alters the rate of a chemical reaction and may be recovered unaltered in nature and amount at the end of the reaction. The catalyst does not affect the position of equilibrium of a reversible reaction.
The atomic number is the number of protons in the atomic nucleus. The atomic number is the essential feature which distinguishes one element from another and determines the position of the element in the periodic table.
Boiling Point Elevation - The presence of a non-volatile solute in a solvent raises the boiling point of the resulting solution compared to the pure solvent; i.e., to achieve a given vapor pressure, the temperature of the solution must be higher than that of the pure substance.
Freezing Point Depression - The presence of a non-volatile solute in a solvent lowers the freezing point of the resulting solution compared to the pure solvent.

## PERIODIC TABLE OF ELEMENTS

IMPORTANT FAMILIES OF ORGANIC COMPOUNDS

|  |  | FAMILY |  |  |  |  |  |  |  |  |  |  |

| * Measured at $25^{\circ} \mathrm{C}$. Reactions are wri cells. | cells. Arrows are reversed for cath |

NOTE: In some chemistry texts, the reactions and the signs of the values (in this table) are reversed; for example, the half-cell potential of zinc is given as -0.763 volt for the reaction $\mathrm{Zn}^{2+}+2 \mathrm{e} \rightarrow \mathrm{Zn}$. When the potential $E_{\mathrm{o}}$ is positive, the reaction proceeds spontaneously as written.

## MATERIALS SCIENCE/STRUCTURE OF MATTER

CRYSTALLOGRAPHY

## Common Metallic Crystal Structures

body-centered cubic, face-centered cubic, and hexagonal close-packed.
-
Body-
Centered
Cubic
(BCC)

Face-
Centered
Cubic
(FCC)

Hexagonal
Close-Packed
(HCP)

## Number of Atoms in a Cell

BCC: 2
FCC: 4
HCP: 6

## Packing Factor

The packing factor is the volume of the atoms in a cell (assuming touching, hard spheres) divided by the total cell volume.

BCC: 0.68
FCC: 0.74
HCP: 0.74

## Coordination Number

The coordination number is the number of closest neighboring (touching) atoms in a given lattice.

## Miller Indices

The rationalized reciprocal intercepts of the intersections of the plane with the crystallographic axes:
-

(111) plane. (axis intercepts at $x=y=z$ ) (112) plane. (axis intercepts at $x=1, y=1, z=1 / 2$ )

(010) planes in cubic structures. (a) Simple cubic. (b) BCC. (axis intercepts at $x=\infty, y=1, z=\infty$ )

(a)

(b)
(110) planes in cubic structures. (a) Simple cubic. (b) BCC. (axis intercepts at $x=1, y=1, z=\infty$ )

## ATOMIC BONDING

## Primary Bonds

Ionic (e.g., salts, metal oxides)
Covalent (e.g., within polymer molecules)
Metallic (e.g., metals)

[^5]
## CORROSION

A table listing the standard electromotive potentials of metals is shown on page 67.
For corrosion to occur, there must be an anode and a cathode in electrical contact in the presence of an electrolyte.

## Anode Reaction (oxidation)

$\mathrm{M}^{0} \rightarrow \mathrm{M}^{n+}+n \mathrm{e}^{-}$

## Possible Cathode Reactions (reduction)

$$
\begin{aligned}
& 1 / 2 \mathrm{O}_{2}+2 \mathrm{e}^{-}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{OH}^{-} \\
& 1 / 2 \mathrm{O}_{2}+2 \mathrm{e}^{-}+2 \mathrm{H}_{3} \mathrm{O}^{+} \rightarrow 3 \mathrm{H}_{2} \mathrm{O} \\
& \quad 2 \mathrm{e}^{-}+2 \mathrm{H}_{3} \mathrm{O}^{+} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2}
\end{aligned}
$$

When dissimilar metals are in contact, the more electropositive one becomes the anode in a corrosion cell. Different regions of carbon steel can also result in a corrosion reaction: e.g., cold-worked regions are anodic to non-coldworked; different oxygen concentrations can cause oxygendeficient region to become cathodic to oxygen-rich regions; grain boundary regions are anodic to bulk grain; in multiphase alloys, various phases may not have the same galvanic potential.

## DIFFUSION

## Diffusion coefficient

$D=D_{\mathrm{o}} \mathrm{e}^{-Q(R T)}$, where
$D=$ the diffusion coefficient,
$D_{\mathrm{o}}=$ the proportionality constant,
$Q=$ the activation energy,
$R=$ the gas constant $[1.987 \mathrm{cal} /(\mathrm{g} \mathrm{mol} \cdot \mathrm{K})]$, and
$T=$ the absolute temperature.

## BINARY PHASE DIAGRAMS

Allows determination of (1) what phases are present at equilibrium at any temperature and average composition, (2) the compositions of those phases, and (3) the fractions of those phases.

Eutectic reaction (liquid $\rightarrow$ two solid phases)
Eutectoid reaction (solid $\rightarrow$ two solid phases)
Peritectic reaction (liquid + solid $\rightarrow$ solid)
Pertectoid reaction (two solid phases $\rightarrow$ solid)

## Lever Rule

The following phase diagram and equations illustrate how the weight of each phase in a two-phase system can be determined:

(In diagram, $L=$ liquid) If $x=$ the average composition at temperature $T$, then

$$
\begin{aligned}
& \mathrm{wt} \% \alpha=\frac{x_{\beta}-x}{x_{\beta}-x_{\alpha}} \times 100 \\
& \mathrm{wt} \% \beta=\frac{x-x_{\alpha}}{x_{\beta}-x_{\alpha}} \times 100
\end{aligned}
$$

## Iron-Iron Carbide Phase Diagram

## Gibbs Phase Rule

$P+F=C+2$, where
$P=$ the number of phases that can coexist in equilibrium,
$F=$ the number of degrees of freedom, and
$C=$ the number of components involved.

[^6]
## THERMAL PROCESSING

Cold working (plastically deforming) a metal increases strength and lowers ductility.
Raising temperature causes (1) recovery (stress relief), (2) recrystallization, and (3) grain growth. Hot working allows these processes to occur simultaneously with deformation.
Quenching is rapid cooling from elevated temperature, preventing the formation of equilibrium phases.
In steels, quenching austenite [FCC ( $\gamma$ ) iron] can result in martensite instead of equilibrium phases-ferrite $[B C C(\alpha)$ iron] and cementite (iron carbide).

## TESTING METHODS

## Standard Tensile Test

Using the standard tensile test, one can determine elastic modulus, yield strength, ultimate tensile strength, and ductility (\% elongation).

## Endurance Test

Endurance tests (fatigue tests to find endurance limit) apply a cyclical loading of constant maximum amplitude. The plot (usually semi-log or $\log -\log$ ) of the maximum stress ( $\sigma$ ) and the number ( $N$ ) of cycles to failure is known as an $S-N$ plot. (Typical of steel, may not be true for other metals; i.e., aluminum alloys, etc.)

The endurance stress (endurance limit or fatigue limit) is the maximum stress which can be repeated indefinitely without causing failure. The fatigue life is the number of cycles required to cause failure for a given stress level.

## Impact Test

The Charpy Impact Test is used to find energy required to fracture and to identify ductile to brittle transition.

Impact tests determine the amount of energy required to cause failure in standardized test samples. The tests are repeated over a range of temperatures to determine the transition temperature.

## HARDENABILITY

Hardenability is the "ease" with which hardness may be attained. Hardness is a measure of resistance to plastic deformation.

(\#2) and (\#8) indicated ASTM grain size
Hardenability Curves for Six Steels
-

(a)

(b)

Cooling Rates for Bars Quenched in (a) Agitated Water and (b) Agitated Oil.

## ASTM GRAIN SIZE

$S_{V}=2 P_{L}$
$N_{\left(0.0645 \mathrm{~mm}^{2}\right)}=2^{(n-1)}$
$\frac{N_{\text {actual }}}{\text { Actual Area }}=\frac{N}{\left(0.0645 \mathrm{~mm}^{2}\right)}$, where
$S_{V}=$ grain-boundary surface per unit volume,
$P_{L}=$ number of points of intersection per unit length between the line and the boundaries,
$N=$ number of grains observed in a area of $0.0645 \mathrm{~mm}^{2}$, and
$n=$ grain size (nearest integer $>1$ ).

## COMPOSITE MATERIALS

$\rho_{c}=\Sigma f_{i} \rho_{i}$
$C_{c}=\Sigma f_{i} c_{i}$
$E_{c}=\Sigma f_{i} E_{i}$, where
$\rho_{c}=$ density of composite,
$C_{c}=$ heat capacity of composite per unit volume,
$E_{c}=$ Young's modulus of composite,
$f_{i}=$ volume fraction of individual material,
$c_{i}=$ heat capacity of individual material per unit volume, and
$E_{i}=$ Young's modulus of individual material.

Also
$\Delta L=$ change in length of a material,
$L=$ original length of the material,
$\alpha=$ coefficient of expansion for a material,
$\Delta T=$ change in temperature for the material,
$e=$ elongation of the material,
$F=$ force in a material,
$A=$ cross-sectional area of the material, and
$E=$ Young's modulus for the material.

$$
\begin{aligned}
& (\Delta L / L)_{1}=(\Delta L / L)_{2} \\
& (\alpha \Delta T+e)_{1}=(\alpha \Delta T+e)_{2} \\
& {[\alpha \Delta T+(F / A) / E]_{1}=[\alpha \Delta T+(F / A) / E]_{2}, \text { where }}
\end{aligned}
$$

## HALF-LIFE

$$
N=N_{o} e^{-0.693 t \tau}, \text { where }
$$

$N_{o}=$ original number of atoms,
$N=$ final number of atoms,
$t=$ time, and
$\tau=$ half-life.

| Material | Density <br> $\boldsymbol{\rho}$ <br> $\mathbf{M g} / \mathbf{m}^{\mathbf{3}}$ | Young's <br> Modulus <br> $\boldsymbol{E}$ | $\boldsymbol{E} / \boldsymbol{\rho}$ <br> $\mathbf{G P a} \cdot \mathbf{m} / \mathbf{g}$ |
| :--- | :---: | :---: | :---: |
| Aluminum | 2.7 | 70 | 26,000 |

| Silicon Carbide fiber | 3.2 | 400 | 120,000 |

## ELECTRIC CIRCUITS

## UNITS

The basic electrical units are coulombs for charge, volts for voltage, amperes for current, and ohms for resistance and impedance.

## ELECTROSTATICS

$\mathbf{F}_{2}=\frac{Q_{1} Q_{2}}{4 \pi \varepsilon r^{2}} \mathbf{a}_{r 12}$, where
$\mathbf{F}_{2}=$ the force on charge 2 due to charge 1,
$Q_{i}=$ the $i$ th point charge,
$r=$ the distance between charges 1 and 2,
$\mathbf{a}_{\mathrm{r} 12}=\mathrm{a}$ unit vector directed from 1 to 2 , and
$\varepsilon=$ the permittivity of the medium.
For free space or air:

$$
\varepsilon=\varepsilon_{0}=8.85 \times 10^{-12} \text { Farads } / \text { meter }
$$

## Electrostatic Fields

Electric field intensity $\mathbf{E}$ (volts/meter) at point 2 due to a point charge $Q_{1}$ at point 1 is

$$
\mathbf{E}=\frac{Q_{1}}{4 \pi \varepsilon r^{2}} \mathbf{a}_{r 12}
$$

For a line charge of density $\rho_{L} \mathrm{C} / \mathrm{m}$ on the $z$-axis, the radial electric field is

$$
\mathbf{E}_{L}=\frac{\rho_{L}}{2 \pi \varepsilon r} \mathbf{a}_{r}
$$

For a sheet charge of density $\rho_{s} \mathrm{C} / \mathrm{m}^{2}$ in the $x-y$ plane:

$$
\mathbf{E}_{s}=\frac{\rho_{s}}{2 \varepsilon} \mathbf{a}_{z}, z>0
$$

Gauss' law states that the integral of the electric flux density $\mathbf{D}=\varepsilon \mathbf{E}$ over a closed surface is equal to the charge enclosed or

$$
Q_{\text {encl }}=\oint_{S} \varepsilon \mathbf{E} \cdot d \mathbf{S}
$$

The force on a point charge $Q$ in an electric field with intensity $\mathbf{E}$ is $\mathbf{F}=\mathrm{Q} \mathbf{E}$.
The work done by an external agent in moving a charge $Q$ in an electric field from point $p_{1}$ to point $p_{2}$ is

$$
W=-Q \int_{p_{1}}^{p_{2}} \mathbf{E} \cdot d \mathbf{l}
$$

The energy stored $W_{E}$ in an electric field $\mathbf{E}$ is

$$
W_{E}=(1 / 2) \iiint \int_{V} \varepsilon|\mathbf{E}|^{2} d v
$$

## Voltage

The potential difference $V$ between two points is the work per unit charge required to move the charge between the points.
For two parallel plates with potential difference $V$, separated by distance $d$, the strength of the $E$ field between the plates is

$$
E=\frac{V}{d}
$$

directed from the + plate to the - plate.

## Current

Electric current $i(t)$ through a surface is defined as the rate of charge transport through that surface or

$$
i(t)=d q(t) / d t \text {, which is a function of time } t
$$

since $q(t)$ denotes instantaneous charge.
A constant $i(t)$ is written as $I$, and the vector current density in amperes $/ \mathrm{m}^{2}$ is defined as $\mathbf{J}$.

## Magnetic Fields

For a current carrying wire on the $z$-axis

$$
\mathbf{H}=\frac{\mathbf{B}}{\mu}=\frac{I \mathbf{a}_{\phi}}{2 \pi r}, \text { where }
$$

$\mathbf{H}=$ the magnetic field strength (amperes/meter),
$\mathbf{B}=$ the magnetic flux density (tesla),
$\mathbf{a}_{\phi}=$ the unit vector in positive $\phi$ direction in cylindrical coordinates,
$I=$ the current, and
$\mu=$ the permeability of the medium.
For air: $\mu=\mu_{0}=4 \pi \times 10^{-7} \mathrm{H} / \mathrm{m}$
Force on a current carrying conductor in a uniform magnetic field is

$$
\mathbf{F}=l \mathbf{L} \times \mathbf{B}, \text { where }
$$

$\mathbf{L}=$ the length vector of a conductor.
The energy stored $W_{H}$ in a magnetic field $\mathbf{H}$ is

$$
W_{H}=(1 / 2) \iiint_{V} \mu|\mathbf{H}|^{2} d v
$$

## Induced Voltage

Faraday's Law; For a coil of $N$ turns enclosing flux $\phi$ :

$$
v=-N d \phi / d t \text {, where }
$$

$v=$ the induced voltage, and
$\phi=$ the flux (webers) enclosed by the $N$ conductor turns, and
$\phi=\int_{S} \mathbf{B} \cdot d \mathbf{S}$

## Resistivity

For a conductor of length $L$, electrical resistivity $\rho$, and area $A$, the resistance is

$$
R=\frac{\rho L}{A}
$$

For metallic conductors, the resistivity and resistance vary linearly with changes in temperature according to the following relationships:

$$
\begin{aligned}
& \rho=\rho_{\mathrm{o}}\left[1+\alpha\left(T-T_{\mathrm{o}}\right)\right] \text {, and } \\
& R=R_{\mathrm{o}}\left[1+\alpha\left(T-T_{\mathrm{o}}\right)\right], \text { where }
\end{aligned}
$$

$\rho_{\mathrm{o}}$ is resistivity at $T_{\mathrm{o}}, R_{\mathrm{o}}$ is the resistance at $T_{\mathrm{o}}$, and $\alpha$ is the temperature coefficient.
Ohm's Law: $\quad V=I R ; v(t)=i(t) R$

## Resistors in Series and Parallel

For series connections, the current in all resistors is the same and the equivalent resistance for $n$ resistors in series is

$$
R_{\mathrm{T}}=R_{1}+R_{2}+\ldots+R_{n}
$$

For parallel connections of resistors, the voltage drop across each resistor is the same and the resistance for $n$ resistors in parallel is

$$
R_{\mathrm{T}}=1 /\left(1 / R_{1}+1 / R_{2}+\ldots+1 / R_{n}\right)
$$

For two resistors $R_{1}$ and $R_{2}$ in parallel

$$
R_{T}=\frac{R_{1} R_{2}}{R_{1}+R_{2}}
$$

## Power in a Resistive Element

$$
P=V I=\frac{V^{2}}{R}=I^{2} R
$$

## Kirchhoff's Laws

Kirchhoff's voltage law for a closed loop is expressed by

$$
\Sigma V_{\text {rises }}=\Sigma V_{\text {drops }}
$$

Kirchhoff's current law for a closed surface is

$$
\Sigma I_{\text {in }}=\Sigma I_{\text {out }}
$$

## SOURCE EQUIVALENTS

For an arbitrary circuit

The Thévenin equivalent is

The open circuit voltage $V_{\text {oc }}$ is $V_{a}-V_{b}$, and the short circuit current is $I_{\mathrm{sc}}$ from $a$ to $b$.
The Norton equivalent circuit is

where $I_{\mathrm{sc}}$ and $R_{\mathrm{eq}}$ are defined above.
A load resistor $R_{L}$ connected across terminals $a$ and $b$ will draw maximum power when $R_{L}=R_{\text {eq }}$.

## CAPACITORS AND INDUCTORS

The charge $q_{C}(t)$ and voltage $v_{C}(t)$ relationship for a capacitor $C$ in farads is

$$
C=q_{C}(t) / v_{C}(t) \quad \text { or } \quad q_{C}(t)=C v_{C}(t)
$$

A parallel plate capacitor of area $A$ with plates separated a distance $d$ by an insulator with a permittivity $\varepsilon$ has a capacitance

$$
C=\frac{\varepsilon A}{d}
$$

The current-voltage relationships for a capacitor are

$$
v_{C}(t)=v_{C}(0)+\frac{1}{C} \int_{0}^{t} i_{C}(\tau) d \tau
$$

and $\quad i_{C}(t)=C\left(d v_{C} / d t\right)$
The energy stored in a capacitor is expressed in joules and given by

$$
\text { Energy }=C v_{C}{ }^{2} / 2=q_{C}{ }^{2} / 2 C=q_{C} v_{C} / 2
$$

The inductance $L$ of a coil is

$$
L=N \phi / i_{L}
$$

and using Faraday's law, the voltage-current relations for an inductor are

$$
\begin{aligned}
& v_{L}(t)=L\left(d i_{L} / d t\right) \\
& i_{L}(t)=i_{L}(0)+\frac{1}{L} \int_{0}^{t} v_{L}(\tau) d \tau, \text { where }
\end{aligned}
$$

$v_{L}=$ inductor voltage,
$L=$ inductance (henrys), and
$i=$ current (amperes).
The energy stored in an inductor is expressed in joules and given by

$$
\text { Energy }=L i_{L}^{2} / 2
$$

## Capacitors and Inductors in Parallel and Series

Capacitors in Parallel

$$
C_{\mathrm{eq}}=C_{1}+C_{2}+\ldots+C_{n}
$$

Capacitors in Series

$$
C_{\mathrm{eq}}=\frac{1}{1 / C_{1}+1 / C_{2}+\ldots+1 / C_{n}}
$$

Inductors In Parallel

$$
L_{\mathrm{eq}}=\frac{1}{1 / L_{1}+1 / L_{2}+\ldots+1 / L_{n}}
$$

Inductors In Series

$$
L_{\mathrm{eq}}=L_{1}+L_{2}+\ldots+L_{n}
$$

## RC AND RL TRANSIENTS

$t \geq 0 ; v_{\mathrm{C}}(t)=v_{\mathrm{C}}(0) e^{-t / R C}+V\left(1-e^{-t / R C}\right)$
$i(t)=\left\{\left[V-v_{C}(0)\right] / R\right\} e^{-t / R C}$

$$
v_{R}(t)=i(t) R=\left[V-v_{C}(0)\right] e^{-t / R C}
$$

$$
\begin{aligned}
t \geq 0 ; i(t) & =i(0) e^{-R t / L}+\frac{V}{R}\left(1-e^{-R t / L}\right) \\
v_{R}(t) & =i(t) R=i(0) R e^{-R t / L}+V\left(1-e^{-R t / L}\right) \\
v_{L}(t) & =L(d i / d t)=-i(0) R e^{-R t / L}+V e^{-R t / L}
\end{aligned}
$$

where $v(0)$ and $i(0)$ denote the initial conditions and the parameters $R C$ and $L / R$ are termed the respective circuit time constants.

OPERATIONAL AMPLIFIERS
$v_{\mathrm{o}}=A\left(v_{1}-v_{2}\right)$
where

$A$ is large ( $>10^{4}$ ), and
$v_{1}-v_{2}$ is small enough so as not to saturate the amplifier.
For the ideal operational amplifier, assume that the input currents are zero and that the gain $A$ is infinite so when operating linearly $v_{2}-v_{1}=0$.
For the two-source configuration with an ideal operational amplifier,

$$
v_{o}=-\frac{R_{2}}{R_{1}} v_{a}+\left(1+\frac{R_{2}}{R_{1}}\right) v_{b}
$$

If $v_{\mathrm{a}}=0$, we have a non-inverting amplifier with

$$
v_{o}=\left(1+\frac{R_{2}}{R_{1}}\right) v_{b}
$$

If $v_{\mathrm{b}}=0$, we have an inverting amplifier with

$$
v_{o}=-\frac{R_{2}}{R_{1}} v_{a}
$$

## AC CIRCUITS

For a sinusoidal voltage or current of frequency $f(\mathrm{~Hz})$ and period $T$ (seconds),

$$
f=1 / T=\omega /(2 \pi) \text {, where }
$$

$\omega=$ the angular frequency in radians/s.

## Average Value

For a periodic waveform (either voltage or current) with period $T$,

$$
X_{\mathrm{ave}}=(1 / T) \int_{0}^{T} x(t) d t
$$

The average value of a full-wave rectified sine wave is

$$
X_{\mathrm{ave}}=\left(2 X_{\max }\right) / \pi
$$

and half this for a half-wave rectification, where
$X_{\text {max }}=$ the peak amplitude of the waveform.

## Effective or RMS Values

For a periodic waveform with period $T$, the rms or effective value is

$$
X_{\mathrm{rms}}=\left[(1 / T)_{0}^{T} x_{0}^{2}(t) d t\right]^{1 / 2}
$$

For a sinusoidal waveform and full-wave rectified sine wave,

$$
X_{\mathrm{rms}}=X_{\max } / \sqrt{2}
$$

For a half-wave rectified sine wave,

$$
X_{\mathrm{rms}}=X_{\max } / 2
$$

## Sine-Cosine Relations

$\cos (\omega t)=\sin (\omega t+\pi / 2)=-\sin (\omega t-\pi / 2)$
$\sin (\omega t)=\cos (\omega t-\pi / 2)=-\cos (\omega t+\pi / 2)$

## Phasor Transforms of Sinusoids

$P\left[V_{\text {max }} \cos (\omega t+\phi)\right]=V_{\text {rms }} \angle \phi=\boldsymbol{V}$
$P\left[I_{\max } \cos (\omega t+\theta)\right]=I_{\mathrm{rms}} \angle \theta=\boldsymbol{I}$
For a circuit element, the impedance is defined as the ratio of phasor voltage to phasor current.

$$
Z=\frac{V}{I}
$$

For a Resistor,

$$
Z_{\mathrm{R}}=R
$$

For a Capacitor,

$$
Z_{\mathrm{C}}=\frac{1}{\mathrm{j} \omega C}=\mathrm{j} X_{\mathrm{C}}
$$

For an Inductor,

$$
Z_{\mathrm{L}}=\mathrm{j} \omega L=\mathrm{j} X_{\mathrm{L}} \text {, where }
$$

$X_{\mathrm{C}}$ and $X_{\mathrm{L}}$ are the capacitive and inductive reactances respectively defined as

$$
X_{C}=-\frac{1}{\omega C} \quad \text { and } \quad X_{L}=\omega L
$$

Impedances in series combine additively while those in parallel combine according to the reciprocal rule just as in the case of resistors.

## Complex Power

Real power $P$ (watts) is defined by

$$
\begin{aligned}
P & =(1 / 2) V_{\max } I_{\max } \cos \theta \\
& =V_{\mathrm{rms}} I_{\mathrm{rms}} \cos \theta
\end{aligned}
$$

where $\theta$ is the angle measured from $\boldsymbol{V}$ to $\boldsymbol{I}$. If $\boldsymbol{I}$ leads (lags) $\boldsymbol{V}$, then the power factor $(p . f$.$) ,$

$$
\text { p.f. }=\cos \theta
$$

is said to be a leading (lagging) p.f.
Reactive power $Q$ (vars) is defined by

$$
\begin{aligned}
Q & =(1 / 2) V_{\max } I_{\max } \sin \theta \\
& =V_{\mathrm{rms}} I_{\mathrm{rms}} \sin \theta
\end{aligned}
$$

Complex power $\boldsymbol{S}$ (volt-amperes) is defined by

$$
\boldsymbol{S}=\boldsymbol{V}^{*}=\mathrm{P}+\mathrm{j} Q,
$$

where $I^{*}$ is the complex conjugate of the phasor current.
For resistors, $\theta=0$, so the real power is

$$
P=V_{r m s} I_{r m s}=V_{r m s}^{2} / R=I_{r m s}^{2} R
$$

## RESONANCE

The radian resonant frequency for both parallel and series resonance situations is

$$
\omega_{o}=\frac{1}{\sqrt{L C}}=2 \pi f_{o}(\mathrm{rad} / \mathrm{s})
$$

## Series Resonance

$$
\begin{aligned}
& \omega_{o} L=\frac{1}{\omega_{o} C} \\
& Z=R \text { at resonance. } \\
& Q=\frac{\omega_{o} L}{R}=\frac{1}{\omega_{o} C R} \\
& B W=\omega_{o} / Q(\mathrm{rad} / \mathrm{s})
\end{aligned}
$$

## Parallel Resonance

$\omega_{o} L=\frac{1}{\omega_{o} C} \quad$ and
$Z=R$ at resonance.

$$
\begin{aligned}
& Q=\omega_{o} R C=\frac{R}{\omega_{o} L} \\
& B W=\omega_{o} / Q(\mathrm{rad} / \mathrm{s})
\end{aligned}
$$

## TRANSFORMERS

## Turns Ratio

$$
\begin{aligned}
& a=N_{\mathrm{l}} / N_{2} \\
& a=\left|\frac{\boldsymbol{V}_{\mathrm{p}}}{\boldsymbol{V}_{\mathrm{s}}}\right|=\left|\frac{\boldsymbol{I}_{\mathrm{s}}}{\boldsymbol{I}_{\mathrm{p}}}\right|
\end{aligned}
$$

The impedance seen at the input is

$$
Z_{\mathrm{P}}=a^{2} Z_{\mathrm{S}}
$$

## ALGEBRA OF COMPLEX NUMBERS

Complex numbers may be designated in rectangular form or polar form. In rectangular form, a complex number is written in terms of its real and imaginary components.

$$
z=a+\mathrm{j} b, \text { where }
$$

$a=$ the real component,
$b=$ the imaginary component, and
$j=\sqrt{-1}$
In polar form

$$
\begin{aligned}
& z=c \angle \theta, \text { where } \\
& c=\sqrt{a^{2}+b^{2}}, \\
& \theta= \tan ^{-1}(b / a), \\
& a=c \cos \theta, \text { and } \\
& b=c \sin \theta .
\end{aligned}
$$

Complex numbers are added and subtracted in rectangular form. If

$$
\begin{aligned}
& z_{1}=a_{1}+\mathrm{j} b_{1}=c_{1}\left(\cos \theta_{1}+\mathrm{j} \sin \theta_{1}\right) \\
&=c_{1} \angle \theta_{1} \text { and } \\
& z_{2}=a_{2}+\mathrm{j} b_{2}=c_{2}\left(\cos \theta_{2}+\mathrm{j} \sin \theta_{2}\right) \\
&=c_{2} \angle \theta_{2}, \text { then } \\
& z_{1}+z_{2}=\left(a_{1}+a_{2}\right)+\mathrm{j}\left(b_{1}+b_{2}\right) \text { and } \\
& z_{1}-z_{2}=\left(a_{1}-a_{2}\right)+\mathrm{j}\left(b_{1}-b_{2}\right)
\end{aligned}
$$

While complex numbers can be multiplied or divided in rectangular form, it is more convenient to perform these operations in polar form.

$$
\begin{aligned}
& z_{1} \times z_{2}=\left(c_{1} \times c_{2}\right) \angle \theta_{1}+\theta_{2} \\
& z_{1} / z_{2}=\left(c_{1} / c_{2}\right) \angle \theta_{1}-\theta_{2}
\end{aligned}
$$

The complex conjugate of a complex number $z_{1}=\left(a_{1}+\mathrm{j} b_{1}\right)$ is defined as $z_{1}{ }^{*}=\left(a_{1}-\mathrm{j} b_{1}\right)$. The product of a complex number and its complex conjugate is $z_{1} z_{1} *=a_{1}{ }^{2}+b_{1}{ }^{2}$.

## COMPUTERS, MEASUREMENT, AND CONTROLS

## COMPUTER KNOWLEDGE

Examinees are expected to possess a level of computer expertise required to perform in a typical undergraduate environment. Thus only generic problems that do not require a knowledge of a specific language or computer type will be required. Examinees are expected to be familiar with flow charts, pseudo code, and spread sheets (Lotus, QuattroPro, Excel, etc.).

## INSTRUMENTATION

## General Considerations

In making any measurement, the response of the total measurement system, including the behavior of the sensors and any signal processors, is best addressed using the methods of control systems. Response time and the effect of the sensor on the parameter being measured may affect accuracy of a measurement. Moreover, many transducers exhibit some sensitivity to phenomena other than the primary parameter being measured. All of these considerations affect accuracy, stability, noise sensitivity, and precision of any measurement. In the case of digital measurement systems, the limit of resolution corresponds to one bit.

## Examples of Types of Sensors

Fluid-based sensors such as manometers, orifice and venturi flow meters, and pitot tubes are discussed in the FLUID MECHANICS section.
Resistance-based sensors include resistance temperature detectors (RTDs), which are metal resistors, and thermistors, which are semiconductors. Both have electrical resistivities that are temperature dependent.
Electrical-resistance strain gages are metallic or semiconducting foils whose resistance changes with dimensional change (strain). They are widely used in load cells. The gage is attached to the surface whose strain is to be measured. The gage factor (G.F.) of these devices is defined by

$$
\text { G.F. }=\frac{\Delta R / R}{\Delta L / L}=\frac{\Delta R / R}{\varepsilon}, \quad \text { where }
$$

$R=$ electrical resistance,
$L=$ the length of the gage section, and
$\varepsilon=$ the normal strain sensed by the gage.
Strain gages sense normal strain along their principal axis. They do not respond to shear strain. Therefore, multiple gages must be used along with Mohr's circle techniques to determine the complete plane strain state.
Resistance-based sensors are generally used in a bridge circuit that detects small changes in resistance. The output of a bridge circuit with only one variable resistor (quarter bridge configuration) is given by

$$
V_{\text {out }}=V_{\text {input }} \times[\Delta R /(4 R)]
$$

Half-bridge and full-bridge configurations use two or four variable resistors, respectively. A full-bridge strain gage circuit gives a voltage output of

$$
V_{\text {out }}=V_{\text {input }} \times \text { G.F. } \times\left(\varepsilon_{1}-\varepsilon_{2}+\varepsilon_{3}-\varepsilon_{4}\right) / 4
$$

Half- or full-strain gage bridge configurations can be developed that are sensitive to only some types of loading (axial, bending, shear) while being insensitive to others.
Piezoelectric sensors produce a voltage in response to a mechanical load. These transducers are widely used as force or pressure transducers. With the addition of an inertial mass, they are used as accelerometers.
Thermocouples are junctions of dissimilar metals which produce a voltage whose magnitude is temperature dependent.
Capacitance-based transducers are used as position sensors. The capacitance of two flat plates depends on their separation or on the area of overlap.
Inductance-based transducers or differential transformers also function as displacement transducers. The inductive coupling between a primary and secondary coil depends on the position of a soft magnetic core. This is the basis for the Linear Variable Differential Transformer (LVDT).

## MEASUREMENT UNCERTAINTY

Suppose that a calculated result $R$ depends on measurements whose values are $x_{1} \pm w_{1}, x_{2} \pm w_{2}, x_{3} \pm w_{3}$, etc., where $R=$ $f\left(x_{1}, x_{2}, x_{3}, \ldots x_{\mathrm{n}}\right), x_{\mathrm{i}}$ is the measured value, and $w_{\mathrm{i}}$ is the uncertainty in that value. The uncertainty in $R$, $w_{R}$, can be estimated using the Kline-McClintock equation:

$$
w_{R}=\sqrt{\left(w_{1} \frac{\partial f}{\partial x_{1}}\right)^{2}+\left(w_{2} \frac{\partial f}{\partial x_{2}}\right)^{2}+\ldots+\left(w_{n} \frac{\partial f}{\partial x_{n}}\right)^{2}}
$$

## CONTROL SYSTEMS

The linear time-invariant transfer function model represented by the block diagram

can be expressed as the ratio of two polynomials in the form

$$
\frac{X(s)}{Y(s)}=G(s)=\frac{N(s)}{D(s)}=\frac{\prod_{m=1}^{M}\left(s-z_{m}\right)}{\prod_{n=1}^{N}\left(s-p_{n}\right)}
$$

where the $M$ zeros, $z_{m}$, and the $N$ poles, $p_{n}$, are the roots of the numerator polynomial, $N(s)$, and the denominator polynomial, $D(s)$, respectively.
One classical negative feedback control system model block diagram is

where $G_{R}(s)$ describes an input processor, $G_{C}(s)$ a controller or compensator, $G_{1}(s)$ and $G_{2}(s)$ represent a partitioned plant model, and $H(s)$ a feedback function. $Y(s)$ represents the controlled variable, $R(s)$ represents the reference input, and $L(s)$ represents a load disturbance. $Y(s)$ is related to $R(s)$ and $L(s)$ by

$$
\begin{aligned}
Y(s)= & \frac{G_{c}(s) G_{1}(s) G_{2}(s) G_{R}(s)}{1+G_{c}(s) G_{1}(s) G_{2}(s) H(s)} R(s) \\
& +\frac{G_{2}(s)}{1+G_{c}(s) G_{1}(s) G_{2}(s) H(s)} L(s)
\end{aligned}
$$

$G_{C}(s) G_{1}(s) G_{2}(s) H(s)$ is the open-loop transfer function. The closed-loop characteristic equation is

$$
1+G_{C}(s) G_{1}(s) G_{2}(s) H(s)=0
$$

System performance studies normally include:

1. Steady-state analysis using constant inputs is based on the Final Value Theorem. If all poles of a $G(s)$ function have negative real parts, then

$$
\text { Steady State Gain }=\lim _{\mathrm{s} \rightarrow 0} G(s)
$$

For the unity feedback control system model

with the open-loop transfer function defined by

$$
G(s)=\frac{K_{B}}{s^{T}} \times \frac{\prod_{m=1}^{M}\left(1+s / \omega_{m}\right)}{\prod_{n=1}^{N}\left(1+s / \omega_{n}\right)}
$$

The following steady-state error analysis table can be constructed where $T$ denotes the type of system; i.e., type 0 , type 1 , etc.

| Steady-State Error $\boldsymbol{e}_{\text {ss }}(\boldsymbol{t})$ |  |  |  |
| :--- | :---: | :---: | :---: |
| Input Type | $T=0$ | $T=1$ | $T=2$ |
| Unit Step | $1 /\left(K_{B}+1\right)$ | 0 | 0 |
| Ramp | $\infty$ | $1 / K_{B}$ | 0 |
| Acceleration | $\infty$ | $\infty$ | $1 / K_{B}$ |

2. Frequency response evaluations to determine dynamic performance and stability. For example, relative stability can be quantified in terms of
a. Gain margin (GM) which is the additional gain required to produce instability in the unity gain feedback control system. If at $\omega=\omega_{180}$,

$$
\begin{aligned}
\angle G\left(\mathrm{j} \omega_{180}\right) & =-180^{\circ} ; \text { then } \\
\mathrm{GM} & =-20 \log _{10}\left(\left|\mathrm{G}\left(\mathrm{j} \omega_{180}\right)\right|\right)
\end{aligned}
$$

b. Phase margin (PM) which is the additional phase required to produce instability. Thus,

$$
\mathrm{PM}=180^{\circ}+\angle G\left(\mathrm{j} \omega_{0 \mathrm{~dB}}\right)
$$

where $\omega_{\mathrm{ddB}}$ is the $\omega$ that satisfies $|G(\mathrm{j} \omega)|=1$.
3. Transient responses are obtained by using Laplace Transforms or computer solutions with numerical integration.
Common Compensator/Controller forms are
PID Controller $G_{C}(s)=K\left(1+\frac{1}{T_{I} s}+T_{D} s\right)$
Lag or Lead Compensator $G_{C}(s)=K\left(\frac{1+s T_{1}}{1+s T_{2}}\right)$
depending on the ratio of $T_{1} / T_{2}$.

## Routh Test

For the characteristic equation

$$
a_{\mathrm{n}} s^{n}+a_{n-1} s^{n-1}+a_{n-2} s^{n-2}+\ldots+a_{0}=0
$$

the coefficients are arranged into the first two rows of an array. Additional rows are computed. The array and coefficient computations are defined by:

| $a_{\mathrm{n}}$ | $a_{n-2}$ | $a_{n-4}$ | $\ldots$ | $\ldots$ | $\ldots$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $a_{n-1}$ | $a_{n-3}$ | $a_{n-5}$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $b_{1}$ | $b_{2}$ | $b_{3}$ | $\ldots$ | $\ldots$ | $\ldots$ |
| $c_{1}$ | $c_{2}$ | $c_{3}$ | $\ldots$ | $\ldots$ | $\ldots$ |

where

$$
\begin{array}{ll}
b_{1}=\frac{a_{n-1} a_{n-2}-a_{n} a_{n-3}}{a_{n-1}} & c_{1}=\frac{a_{n-3} b_{1}-a_{n-1} b_{2}}{b_{1}} \\
b_{2}=\frac{a_{n-1} a_{n-4}-a_{n} a_{n-5}}{a_{n-1}} & c_{2}=\frac{a_{n-5} b_{1}-a_{n-1} b_{3}}{b_{1}}
\end{array}
$$

The necessary and sufficient conditions for all the roots of the equation to have negative real parts is that all the elements in the first column be of the same sign and nonzero.

## Second-Order Control-System Models

One standard second-order control-system model is

$$
\frac{Y(s)}{R(s)}=\frac{K \omega_{n}^{2}}{s^{2}+2 \zeta \omega_{n} s+\omega_{n}^{2}}, \text { where }
$$

$K=$ steady state gain,
$\zeta=$ the damping ratio,
$\omega_{n}=$ the undamped natural $(\zeta=0)$ frequency,
$\omega_{d}=\omega_{n} \sqrt{1-\zeta^{2}}$, the damped natural frequency,
and

$$
\omega_{p}=\omega_{n} \sqrt{1-2 \zeta^{2}} \text {, the damped resonant frequency. }
$$

If the damping ratio $\zeta$ is less than unity, the system is said to be underdamped; if $\zeta$ is equal to unity, it is said to be critically damped; and if $\zeta$ is greater than unity, the system is said to be overdamped.
For a unit step input to a normalized underdamped secondorder control system, the time required to reach a peak value $t_{p}$ and the value of that peak $M_{p}$ are given by

$$
\begin{aligned}
& t_{p}=\pi /\left(\omega_{n} \sqrt{1-\zeta^{2}}\right) \\
& M_{p}=1+e^{-\pi \zeta / \sqrt{1-\zeta^{2}}}
\end{aligned}
$$

For an underdamped second-order system, the logarithmic decrement is

$$
\delta=\frac{1}{m} \ln \left(\frac{x_{k}}{x_{k+m}}\right)=\frac{2 \pi \zeta}{\sqrt{1-\zeta^{2}}}
$$

where $x_{k}$ and $x_{k+m}$ are the amplitudes of oscillation at cycles $k$ and $k+m$, respectively. The period of oscillation $\tau$ is related to $\omega_{d}$ by

$$
\omega_{d} \tau=2 \pi
$$

The time required for the output of a second-order system to settle to within $2 \%$ of its final value is defined to be

$$
T_{s}=\frac{4}{\zeta \omega_{n}}
$$

## State-Variable Control-System Models

One common state-variable model for dynamic systems has the form

$$
\begin{array}{rlr}
\dot{\mathbf{x}}(t) & =\mathbf{A} \mathbf{x}(t)+\mathbf{B u}(t) & \text { (state equation) } \\
\mathbf{y}(t) & =\mathbf{C} \mathbf{x}(t)+\mathbf{D u}(t) & \text { (output equation) }
\end{array}
$$

where
$\mathbf{x}(t)=\quad N$ by 1 state vector ( $N$ state variables),
$\mathbf{u}(t)=R$ by 1 input vector ( $R$ inputs),
$\mathbf{y}(t)=M$ by 1 output vector ( $M$ outputs),
$\mathbf{A}=$ system matrix,
B $=$ input distribution matrix,
$\mathbf{C}=$ output matrix, and
D $=$ feed-through matrix.
The orders of the matrices are defined via variable definitions.
State-variable models automatically handle multiple inputs and multiple outputs. Furthermore, state-variable models can be formulated for open-loop system components or the complete closed-loop system.
The Laplace transform of the time-invariant state equation is

$$
s \mathbf{X}(s)-\mathbf{x}(0)=\mathbf{A} \mathbf{X}(s)+\mathbf{B U}(s)
$$

from which

$$
\mathbf{X}(s)=\boldsymbol{\Phi}(s) \mathbf{x}(0)+\boldsymbol{\Phi}(s) \mathbf{B U}(s)
$$

where the Laplace transform of the state transition matrix is

$$
\boldsymbol{\Phi}(s)=[s \mathbf{I}-\mathbf{A}]^{-1} .
$$

The state-transition matrix

$$
\boldsymbol{\Phi}(t)=L^{-1}\{\boldsymbol{\Phi}(s)\}
$$

(also defined as $e^{\mathbf{A t}}$ ) can be used to write

$$
\mathbf{x}(t)=\boldsymbol{\Phi}(t) \mathbf{x}(0)+\int_{0}^{t} \Phi(t-\tau) \mathbf{B u}(\tau) d \tau
$$

The output can be obtained with the output equation; e.g., the Laplace transform output is

$$
\mathbf{Y}(s)=\{\mathbf{C} \boldsymbol{\Phi}(s) \mathbf{B}+\mathbf{D}\} \mathbf{U}(s)+\mathbf{C} \boldsymbol{\Phi}(s) \mathbf{x}(0)
$$

The latter term represents the output(s) due to initial conditions whereas the former term represents the output(s) due to the $\mathbf{U}(s)$ inputs and gives rise to transfer function definitions.

ENGINEERING ECONOMICS

## NOMENCLATURE AND DEFINITIONS

A.......... Uniform amount per interest period
B.......... Benefit

BV ....... Book Value
C. $\qquad$ Cost
d.......... Combined interest rate per interest period
$D_{j \ldots \ldots . . . . . ~ D e p r e c i a t i o n ~ i n ~ y e a r ~}^{j}$
$F$.......... Future worth, value, or amount
$f$........... General inflation rate per interest period
G ......... Uniform gradient amount per interest period
$i$........... Interest rate per interest period
$i_{\mathrm{e}} \ldots . . . . . .$. Annual effective interest rate
$m$......... Number of compounding periods per year
$n$.......... Number of compounding periods; or the expected life of an asset
P.......... Present worth, value, or amount
$r$........... Nominal annual interest rate
$S_{n} \ldots \ldots . .$. . Expected salvage value in year $n$

## Subscripts

$j$. $\qquad$
$n$. $\qquad$ at time $n$
** ........ $P / G=(F / G) /(F / P)=(P / A) \times(A / G)$
$\dagger \ldots . . . . . . . F / G=(F / A-n) / i=(F / A) \times(A / G)$
$\ddagger$ $\qquad$ $A / G=[1-n(A / F)] / i$

## NON-ANNUAL COMPOUNDING

$$
i_{e}=\left(1+\frac{r}{m}\right)^{m}-1
$$

## Discount Factors for Continuous Compounding

( $n$ is the number of years)
$(F / P, r \%, n)=e^{r n}$
$(P / F, r \%, n)=\mathrm{e}^{-r n}$
$(A / F, r \%, n)=\frac{e^{r}-1}{e^{r n}-1}$
$(F / A, r \%, n)=\frac{e^{r n}-1}{e^{r}-1}$
$(A / P, r \%, n)=\frac{e^{r}-1}{1-e^{-r n}}$
$(P / A, r \%, n)=\frac{1-e^{-r n}}{e^{r}-1}$

## BOOK VALUE

$B V=$ initial cost $-\Sigma D_{j}$

## DEPRECIATION

Straight Line

$$
D_{j}=\frac{C-S_{n}}{n}
$$

## Accelerated Cost Recovery System (ACRS)

$$
D_{j}=(\text { factor }) C
$$

A table of modified factors is provided below.

## CAPITALIZED COSTS

Capitalized costs are present worth values using an assumed perpetual period of time.

$$
\text { Capitalized Costs }=P=\frac{A}{i}
$$

## BONDS

Bond Value equals the present worth of the payments the purchaser (or holder of the bond) receives during the life of the bond at some interest rate $i$.

Bond Yield equals the computed interest rate of the bond value when compared with the bond cost.

## RATE-OF-RETURN

The minimum acceptable rate-of-return is that interest rate that one is willing to accept, or the rate one desires to earn on investments. The rate-of-return on an investment is the interest rate that makes the benefits and costs equal.

## BREAK-EVEN ANALYSIS

By altering the value of any one of the variables in a situation, holding all of the other values constant, it is possible to find a value for that variable that makes the two alternatives equally economical. This value is the breakeven point.
Break-even analysis is used to describe the percentage of capacity of operation for a manufacturing plant at which income will just cover expenses.
The payback period is the period of time required for the profit or other benefits of an investment to equal the cost of the investment.

## INFLATION

To account for inflation, the dollars are deflated by the general inflation rate per interest period $f$, and then they are shifted over the time scale using the interest rate per interest period $i$. Use a combined interest rate per interest period $d$ for computing present worth values $P$ and Net $P$. The formula for $d$ is

$$
d=i+f+(i \times f)
$$

## BENEFIT-COST ANALYSIS

In a benefit-cost analysis, the benefits $B$ of a project should exceed the estimated costs $C$.

$$
B-C \geq 0, \text { or } \quad B / C \geq 1
$$

| MODIFIED ACRS FACTORS |  |  |  |  |

## ETHICS

Engineering is considered to be a "profession" rather than an "occupation" because of several important characteristics shared with other recognized learned professions, law, medicine, and theology: special knowledge, special privileges, and special responsibilities. Professions are based on a large knowledge base requiring extensive training. Professional skills are important to the well-being of society. Professions are self-regulating, in that they control the training and evaluation processes that admit new persons to the field. Professionals have autonomy in the workplace; they are expected to utilize their independent judgment in carrying out their professional responsibilities. Finally, professions are regulated by ethical standards. ${ }^{1}$

The expertise possessed by engineers is vitally important to public welfare. In order to serve the public effectively, engineers must maintain a high level of technical competence. However, a high level of technical expertise without adherence to ethical guidelines is as much a threat to public welfare as is professional incompetence. Therefore, engineers must also be guided by ethical principles.
The ethical principles governing the engineering profession are embodied in codes of ethics. Such codes have been adopted by state boards of registration, professional engineering societies, and even by some private industries. An example of one such code is the NCEES Model Rules of Professional Conduct, which is presented here in its entirety. As part of his/her responsibility to the public, an engineer is responsible for knowing and abiding by the code.

The three major sections of the model rules address (1) Licensee's Obligations to Society, (2) Licensee's Obligations to Employers and Clients, and (3) Licensee's Obligations to Other Licensees. The principles amplified in these sections are important guides to appropriate behavior of professional engineers.
Application of the code in many situations is not controversial. However, there may be situations in which applying the code may raise more difficult issues. In particular, there may be circumstances in which terminology in the code is not clearly defined, or in which two sections of the code may be in conflict. For example, what constitutes "valuable consideration" or "adequate" knowledge may be interpreted differently by qualified professionals. These types of questions are called conceptual issues, in which definitions of terms may be in dispute. In other situations, factual issues may also affect ethical dilemmas. Many decisions regarding engineering design may be based upon interpretation of disputed or incomplete information. In addition, tradeoffs revolving around competing issues of risk vs. benefit, or safety $v s$. economics may require judgments that are not fully addressed simply by application of the code.

No code can give immediate and mechanical answers to all ethical and professional problems that an engineer may face. Creative problem solving is often called for in ethics, just as it is in other areas of engineering.

## NCEES Model Rules of Professional Conduct PREAMBLE

To comply with the purpose of the (identify jurisdiction, licensing statute)-which is to safeguard life, health, and property, to promote the public welfare, and to maintain a high standard of integrity and practice-the (identify board, licensing statute) has developed the following Rules of Professional Conduct. These rules shall be binding on every person holding a certificate of licensure to offer or perform engineering or land surveying services in this state. All persons licensed under (identify jurisdiction's licensing statute) are required to be familiar with the licensing statute and these rules. The Rules of Professional Conduct delineate specific obligations the licensee must meet. In addition, each licensee is charged with the responsibility of adhering to the highest standards of ethical and moral conduct in all aspects of the practice of professional engineering and land surveying.
The practice of professional engineering and land surveying is a privilege, as opposed to a right. All licensees shall exercise their privilege of practicing by performing services only in the areas of their competence according to current standards of technical competence.
Licensees shall recognize their responsibility to the public and shall represent themselves before the public only in an objective and truthful manner.
They shall avoid conflicts of interest and faithfully serve the legitimate interests of their employers, clients, and customers within the limits defined by these rules. Their professional reputation shall be built on the merit of their services, and they shall not compete unfairly with others.

The Rules of Professional Conduct as promulgated herein are enforced under the powers vested by (identify jurisdiction's enforcing agency). In these rules, the word "licensee" shall mean any person holding a license or a certificate issued by (identify jurisdiction's licensing agency).

[^7]
## I. LICENSEE'S OBLIGATION TO SOCIETY

a. Licensees, in the performance of their services for clients, employers, and customers, shall be cognizant that their first and foremost responsibility is to the public welfare.
b. Licensees shall approve and seal only those design documents and surveys that conform to accepted engineering and land surveying standards and safeguard the life, health, property, and welfare of the public.
c. Licensees shall notify their employer or client and such other authority as may be appropriate when their professional judgment is overruled under circumstances where the life, health, property, or welfare of the public is endangered.
d. Licensees shall be objective and truthful in professional reports, statements, or testimony. They shall include all relevant and pertinent information in such reports, statements, or testimony.
e. Licensees shall express a professional opinion publicly only when it is founded upon an adequate knowledge of the facts and a competent evaluation of the subject matter.
f. Licensees shall issue no statements, criticisms, or arguments on technical matters which are inspired or paid for by interested parties, unless they explicitly identify the interested parties on whose behalf they are speaking and reveal any interest they have in the matters.
g. Licensees shall not permit the use of their name or firm name by, nor associate in the business ventures with, any person or firm which is engaging in fraudulent or dishonest business or professional practices.
h. Licensees having knowledge of possible violations of any of these Rules of Professional Conduct shall provide the board with the information and assistance necessary to make the final determination of such violation.

## II. LICENSEE'S OBLIGATION TO EMPLOYER AND CLIENTS

a. Licensees shall undertake assignments only when qualified by education or experience in the specific technical fields of engineering or land surveying involved.
b. Licensees shall not affix their signatures or seals to any plans or documents dealing with subject matter in which they lack competence, nor to any such plan or document not prepared under their direct control and personal supervision.
c. Licensees may accept assignments for coordination of an entire project, provided that each design segment is signed and sealed by the licensee responsible for preparation of that design segment.
d. Licensees shall not reveal facts, data, or information obtained in a professional capacity without the prior consent of the client or employer except as authorized or required by law.
e. Licensees shall not solicit or accept financial or other valuable consideration, directly or indirectly, from contractors, their agents, or other parties in connection with work for employers or clients.
f. Licensees shall make full prior disclosures to their employers or clients of potential conflicts of interest or other circumstances which could influence or appear to influence their judgment or the quality of their service.
g. Licensees shall not accept compensation, financial or otherwise, from more than one party for services pertaining to the same project, unless the circumstances are fully disclosed and agreed to by all interested parties.
h. Licensees shall not solicit or accept a professional contract from a governmental body on which a principal or officer of their organization serves as a member. Conversely, licensees serving as members, advisors, or employees of a government body or department, who are the principals or employees of a private concern, shall not participate in decisions with respect to professional services offered or provided by said concern to the governmental body which they serve.

## III. LICENSEE'S OBLIGATION TO OTHER LICENSEES

a. Licensees shall not falsify or permit misrepresentation of their, or their associates', academic or professional qualifications. They shall not misrepresent or exaggerate their degree of responsibility in prior assignments nor the complexity of said assignments. Presentations incident to the solicitation of employment or business shall not misrepresent pertinent facts concerning employers, employees, associates, joint ventures, or past accomplishments.
b. Licensees shall not offer, give, solicit, or receive, either directly or indirectly, any commission, or gift, or other valuable consideration in order to secure work, and shall not make any political contribution with the intent to influence the award of a contract by public authority.
c. Licensees shall not attempt to injure, maliciously or falsely, directly or indirectly, the professional reputation, prospects, practice, or employment of other licensees, nor indiscriminately criticize other licensees' work.

## CHEMICAL ENGINEERING

For additional information concerning heat transfer and fluid mechanics, refer to the HEAT TRANSFER, THERMODYNAMICS, or FLUID MECHANICS sections.

## CHEMICAL THERMODYNAMICS

## Vapor-Liquid Equilibrium

For a multi-component mixture at equilibrium

$$
\hat{f}_{i}^{V}=\hat{f}_{i}^{L}, \text { where }
$$

$\hat{f}_{i}^{V}=$ fugacity of component $i$ in the vapor phase, and
$\hat{f}_{i}^{L}=$ fugacity of component $i$ in the liquid phase.
Fugacities of component $i$ in a mixture are commonly calculated in the following ways:
For a liquid $\quad \hat{f}_{i}^{L}=x_{i} \gamma_{i} f_{i}^{L}$, where
$x_{i}=$ mole fraction of component $i$,
$\gamma_{i}=$ activity coefficient of component $i$, and
$f_{i}^{\mathrm{L}}=$ fugacity of pure liquid component $i$.
For a vapor $\hat{f}_{i}^{V}=y_{i} \hat{\Phi}_{i} P$, where
$\mathrm{y}_{i}=$ mole fraction of component $i$ in the vapor,
$\hat{\Phi}_{i}=$ fugacity coefficient of component $i$ in the vapor, and
$P=$ system pressure.
The activity coefficient $\gamma_{i}$ is a correction for liquid phase non-ideality. Many models have been proposed for $\gamma_{i}$ such as the Van Laar model:

$$
\begin{aligned}
& \ln \gamma_{1}=A_{12}\left(1+\frac{A_{12} x_{1}}{A_{21} x_{2}}\right)^{-2} \\
& \ln \gamma_{2}=A_{21}\left(1+\frac{A_{21} x_{2}}{A_{12} x_{1}}\right)^{-2}
\end{aligned}
$$

$\gamma_{1}=$ activity coefficient of component 1 in a twocomponent system,
$\gamma_{2}=$ activity coefficient of component 2 in a twocomponent system, and
$A_{12}, A_{21}=$ constants, typically fitted from experimental data.
The pure component fugacity is calculated as:

$$
f_{i}^{\mathrm{L}}=\Phi_{i}^{\text {sat }} P_{i}^{\text {sat }} \exp \left\{v_{i}^{L}\left(P-P_{i}^{\text {sat }}\right) /(R T)\right\}, \text { where }
$$

$\Phi_{i}^{\text {sat }}=$ fugacity coefficient of pure saturated $i$,
$P_{i}^{\text {sat }}=$ saturation pressure of pure $i$,
$v_{i}^{L}=$ specific volume of pure liquid $i$, and
$R=$ Ideal Gas Law Constant.

Often at system pressures close to atmospheric:

$$
f_{i}^{\mathrm{L}} \cong P_{i}^{\mathrm{sat}}
$$

The fugacity coefficient $\hat{\Phi}_{i}$ for component $i$ in the vapor is calculated from an equation of state (e.g., Virial). Sometimes it is approximated by a pure component value from a correlation. Often at pressures close to atmospheric, $\hat{\Phi}_{i}=1$. The fugacity coefficient is a correction for vapor phase non-ideality.
For sparingly soluble gases the liquid phase is sometimes represented as

$$
\hat{f}_{i}^{L}=x_{i} k_{i}
$$

where $k_{i}$ is a constant set by experiment (Henry's constant). Sometimes other concentration units are used besides mole fraction with a corresponding change in $k_{i}$.

## Chemical Reaction Equilibrium

For reaction

$$
\begin{gathered}
\mathrm{aA}+\mathrm{bB} \leftrightharpoons \mathrm{cC}+\mathrm{dD} \\
\Delta G^{\mathrm{o}}=-R T \ln K_{a} \\
K_{a}=\frac{\left(\hat{a}_{C}^{c}\right)\left(\hat{a}_{D}^{d}\right)}{\left(\hat{a}_{A}^{a}\right)\left(\hat{a}_{B}^{b}\right)}=\prod_{i}\left(\hat{a}_{i}\right)^{\mathrm{v}_{i}}, \text { where } \\
\hat{a}_{i}= \\
\text { activity of component } \mathrm{i}=\frac{\hat{f}_{i}}{f_{i}^{o}} \\
f_{i}^{\mathrm{o}}= \\
\mathrm{v}_{i}= \\
\text { fugacity of pure } i \text { in its standard state } \\
\Delta G^{\mathrm{o}}= \\
K_{a}= \\
\text { staichiometric coefficient of component } i \\
K_{a}=\text { chemical equilibrium constant }
\end{gathered}
$$

For mixtures of ideal gases:

$$
f_{i}^{0}=\text { unit pressure, often } 1 \text { bar }
$$

$$
\hat{f_{i}}=y_{i} P=p_{i}
$$

where $p_{i}=$ partial pressure of component $i$.
Then $K_{a}=K_{p}=\frac{\left(p_{C}^{c}\right)\left(p_{D}^{d}\right)}{\left(p_{A}^{a}\right)\left(p_{B}^{b}\right)}=P^{c+d-a-b} \frac{\left(y_{C}^{c}\right)\left(y_{D}^{d}\right)}{\left(y_{A}^{a}\right)\left(y_{B}^{b}\right)}$
For solids $\quad \hat{a}_{i}=1$
For liquids $\quad \hat{a}_{i}=\mathrm{x}_{i} \gamma_{i}$
The effect of temperature on the equilibrium constant is

$$
\frac{\mathrm{d} \ln K}{\mathrm{~d} T}=\frac{\Delta H^{o}}{R T^{2}}
$$

where $\Delta H^{\circ}=$ standard enthalpy change of reaction.

## HEATS OF REACTION

For a chemical reaction the associated energy can be defined in terms of heats of formation of the individual species $\left(\Delta \hat{H}_{f}^{o}\right)$ at the standard state

$$
\left(\Delta \hat{H}_{\mathrm{r}}^{\mathrm{o}}\right)=\sum_{\text {products }} \nu_{i}\left(\Delta \hat{H}_{\mathrm{f}}^{\mathrm{o}}\right)_{i}-\sum_{\text {reactants }} \nu_{i}\left(\Delta \hat{H}_{\mathrm{f}}^{\mathrm{o}}\right)_{i}
$$

The standard state is $25^{\circ} \mathrm{C}$ and 1 bar.
The heat of formation is defined as the enthalpy change associated with the formation of a compound from its atomic species as they normally occur in nature (i.e., $\mathrm{O}_{2(\mathrm{~g})}$, $\mathrm{H}_{2(\mathrm{~g})}, \mathrm{C}_{\text {(solid) }}$, etc.)
The heat of reaction for a combustion process using oxygen is also known as the heat of combustion. The principal products are $\mathrm{CO}_{2(\mathrm{~g})}$ and $\mathrm{H}_{2} \mathrm{O}_{(\mathrm{e})}$.

## CHEMICAL REACTION ENGINEERING

A chemical reaction may be expressed by the general equation

$$
a \mathrm{~A}+b \mathrm{~B} \leftrightarrow c \mathrm{C}+d \mathrm{D} .
$$

The rate of reaction of any component is defined as the moles of that component formed per unit time per unit volume.

$$
\begin{array}{ll}
-r_{A}=-\frac{1}{V} \frac{d N_{A}}{d t} & \text { [negative because A disappears] } \\
-r_{A}=\frac{-d C_{A}}{d t} & \text { if } \mathrm{V} \text { is constant }
\end{array}
$$

The rate of reaction is frequently expressed by

$$
-r_{A}=k f_{r}\left(C_{A}, C_{B}, \ldots .\right), \text { where }
$$

$k=$ reaction rate constant and
$C_{I}=$ concentration of component $I$.
The Arrhenius equation gives the dependence of $k$ on temperature

$$
\mathrm{k}=\mathrm{Ae}^{-\mathrm{E}_{\mathrm{a}} / \overline{\mathrm{R}} \mathrm{~T}} \text {, where }
$$

$A=$ pre-exponential or frequency factor,
$E_{a}=$ activition energy ( $\mathrm{J} / \mathrm{mol}, \mathrm{cal} / \mathrm{mol}$ ),
$T=$ temperature (K), and
$\bar{R}=$ gas law constant $=8.314 \mathrm{~J} /(\mathrm{mol} \cdot \mathrm{K})$.
In the conversion of $A$, the fractional conversion $X_{A}$, is defined as the moles of $A$ reacted per mole of $A$ fed.

$$
X_{A}=\left(C_{A 0}-C_{A}\right) / C_{A 0} \quad \text { if } \mathrm{V} \text { is constant }
$$

## Reaction Order

If $-r_{A}=k C_{A}{ }^{x} C_{B}{ }^{y}$
the reaction is $x$ order with respect to reactant $A$ and $y$ order with respect to reactant $B$. The overall order is

$$
n=x+y
$$

## BATCH REACTOR, CONSTANT T AND V

Zero-Order Reaction

| $-r_{A}=$ | $k C_{A}{ }^{o}=k(1)$ |  |
| :--- | :--- | :--- |
| $-d C_{A} / d t=$ | $k$ | or |
| $C_{A}=$ | $C_{A o}-k t$ |  |
| $d X_{A} / d t=$ | $k / C_{A o}$ | or |
| $C_{A o} X_{A}=$ | $k t$ |  |

## First-Order Reaction

$-\mathrm{r}_{A}=k C_{A}$
$-d C_{A} / d t=\quad k C_{A} \quad$ or
$\ln \left(C_{A} / C_{A o}\right)=\quad-k t$
$d X_{A} / d t=k\left(1-X_{A}\right) \quad$ or
$\ln \left(1-X_{A}\right)=\quad-k t$
(1 $X_{1}$ )
Second-Order Reaction

$$
\begin{array}{lc}
-\mathrm{r}_{A}=k C_{A}{ }^{2} & \\
-d C_{A} / d t=k C_{A}{ }^{2} & \text { or } \\
1 / C_{A}-1 / C_{A o}=k t & \\
d X_{A} / d t=k C_{A o}\left(1-X_{A}\right)^{2} & \text { or } \\
X_{A}\left[C_{A o}\left(1-X_{A}\right)\right]=k t &
\end{array}
$$

## Batch Reactor, General

For a well-mixed, constant-volume, batch reactor

$$
\begin{aligned}
& -\mathrm{r}_{A}=d C_{A} / d t \\
& t=-C_{A 0} \int_{o}^{X_{A}} d X_{A} /\left(-r_{A}\right)
\end{aligned}
$$

If the volume of the reacting mass varies with the conversion according to

$$
\begin{aligned}
& \mathrm{V}=\mathrm{V}_{\mathrm{X}_{\mathrm{A}=0}}\left(1+\varepsilon_{\mathrm{A}} \mathrm{X}_{\mathrm{A}}\right) \\
& \varepsilon_{A}=\frac{V_{X_{A}=1}-V_{X_{A}=0}}{V_{X_{A}=0}}
\end{aligned}
$$

then

$$
t=-C_{A o} \int_{o}^{X_{A}} d X_{A} /\left[\left(1+\varepsilon_{A} X_{A}\right)\left(-r_{A}\right)\right]
$$

## FLOW REACTORS, STEADY STATE

Space-time $\tau$ is defined as the reactor volume divided by the inlet volumetric feed rate. Space-velocity $S V$ is the reciprocal of space-time, $S V=1 / \tau$.

## Plug-Flow Reactor (PFR)

$$
\tau=\frac{C_{A o} V_{P F R}}{F_{A o}}=C_{A o} \int_{o}^{X_{A}} \frac{d X_{A}}{\left(-r_{A}\right)} \text {, where }
$$

$\mathrm{F}_{\mathrm{Ao}}=$ moles of $A$ fed per unit time.

## Continuous Stirred Tank Reactor (CSTR)

For a constant volume, well-mixed, CSTR

$$
\frac{\tau}{C_{\mathrm{Ao}}}=\frac{V_{\mathrm{CSTR}}}{F_{\mathrm{Ao}}}=\frac{X_{\mathrm{A}}}{-r_{\mathrm{A}}} \text {, where }
$$

$-\mathrm{r}_{A}$ is evaluated at exit stream conditions.

## Continuous Stirred Tank Reactors in Series

With a first-order reaction $A \rightarrow R$, no change in volume.

$$
\begin{aligned}
\tau_{N-\text { reactors }} & =N \tau_{\text {individual }} \\
& =\frac{N}{k}\left[\left(\frac{C_{A o}}{C_{A N}}\right)^{1 / N}-1\right], \text { where }
\end{aligned}
$$

$N=$ number of CSTRs (equal volume) in series, and $C_{A N}=$ concentration of $A$ leaving the $N$ th CSTR.

## DISTILLATION

## Flash (or equilibrium) Distillation

Component material balance:

$$
F z_{F}=y V+x L
$$

Overall material balance:

$$
F=V+L
$$

## Differential (Simple or Rayleigh) Distillation

$$
\ln \left(\frac{W}{W_{o}}\right)=\int_{x_{o}}^{x} \frac{d x}{y-x}
$$

When the relative volatility $\alpha$ is constant,

$$
y=\alpha x /[1+(\alpha-1) x]
$$

can be substituted to give

$$
\ln \left(\frac{W}{W_{o}}\right)=\frac{1}{(\alpha-1)} \ln \left[\frac{x\left(1-x_{o}\right)}{x_{o}(1-x)}\right]+\ln \left[\frac{1-x_{o}}{1-x}\right]
$$

For binary system following Raoult's Law

$$
\alpha=(y / x)_{a} /(y / x)_{b}=p_{a} / p_{b}, \text { where }
$$

$p_{i}=$ partial pressure of component $i$.

## Continuous Distillation (binary system)

Constant molal overflow is assumed (trays counted downward)

## Overall Material Balances

## Total Material:

$$
F=D+B
$$

Component $A$ :

$$
F z_{F}=D x_{D}+B x_{B}
$$

## Operating Lines

## Rectifying Section

## Total Material:

$$
V_{n+1}=L_{n}+D
$$

Component $A$ :

$$
\begin{aligned}
& V_{n+1} y_{n+1}=L_{n} x_{n}+D x_{D} \\
& y_{n+1}=\left[L_{n} /\left(L_{n}+D\right)\right] x_{n}+D x_{D} /\left(L_{n}+D\right)
\end{aligned}
$$

## Stripping Section

Total Material:

$$
L_{m}=V_{m+1}+B
$$

Component $A$ :

$$
\begin{aligned}
& L_{m} x_{m}=V_{m+1} y_{m+1}+B x_{B} \\
& y_{m+1}=\left[L_{m} /\left(L_{m}-B\right)\right] x_{m}-B x_{B} /\left(L_{m}-B\right)
\end{aligned}
$$

## Reflux Ratio

Ratio of reflux to overhead product

$$
R_{D}=L / D=(V-D) / D
$$

Minimum reflux ratio is defined as that value which results in an infinite number of contact stages. For a binary system the equation of the operating line is

$$
y=\frac{R_{\min }}{R_{\min }+1} x+\frac{x_{D}}{R_{\min }+1}
$$

## Feed Condition Line

slope $=q /(q-1)$, where

$$
q=\frac{\text { heat to convert one mol of feed to saturated vapor }}{\text { molar heat of vaporization }}
$$

Murphree Plate Efficiency
$E_{M E}=\left(y_{n}-y_{n+1}\right) /\left(y^{*}{ }_{n}-y_{n+1}\right)$, where
$y=$ concentration of vapor above plate $n$, $y_{n+1}=$ concentration of vapor entering from plate below $n$, and
$y_{n}^{*}=$ concentration of vapor in equilibrium with liquid leaving plate $n$.

A similar expression can be written for the stripping section by replacing $n$ with $m$.
Definitions:
$\alpha=$ relative volatility,
$B=$ molar bottoms-product rate,
$D=$ molar overhead-product rate,
$F=$ molar feed rate,
$L=$ molar liquid downflow rate,
$R_{D}=$ ratio of reflux to overhead product,
$V=$ molar vapor upflow rate,
$W=$ weight in still pot,
$x=$ mole fraction of the more volatile component in the liquid phase, and
$y=$ mole fraction of the more volatile component in the vapor phase.

Subscripts
$B=$ bottoms product,
$D=$ overhead product,
$F=$ feed,
$m=$ any plate in stripping section of column,
$m+1=$ plate below plate $m$,
$n \quad=$ any plate in rectifying section of column,
$n+1=$ plate below plate $n$, and
$o \quad=$ original charge in still pot.

LIQUID MOLE FRACTION OF MORE VOLATILE COMPONENT

## MASS TRANSFER

## Diffusion

## Molecular Diffusion

Gas: $\frac{N_{A}}{A}=\frac{p_{A}}{P}\left(\frac{N_{A}}{A}+\frac{N_{B}}{A}\right)-\frac{D_{m}}{R T} \frac{\partial p_{A}}{\partial z}$
Liquid: $\frac{N_{A}}{A}=x_{A}\left(\frac{N_{A}}{A}+\frac{N_{B}}{A}\right)-C D_{m} \frac{\partial x_{A}}{\partial z}$
in which $\left(p_{B}\right)_{l m}$ is the $\log$ mean of $p_{B 2}$ and $p_{B 1}$,
Unidirectional Diffusion of a Gas A Through a Second
Stagnant Gas B ( $\mathrm{N}_{\mathrm{b}}=0$ )

$$
\frac{N_{A}}{A}=\frac{D_{m} P}{\bar{R} T\left(p_{B}\right)_{\operatorname{lm}}} \times \frac{\left(p_{A 2}-p_{A 1}\right)}{z_{2}-z_{1}}
$$

in which $\left(p_{B}\right)_{\mathrm{lm}}$ is the $\log$ mean of $p_{B 2}$ and $p_{B 1}$,
$N_{I}=$ diffusive flow of component $I$ through area $A$, in $z$ direction, and
$D_{m}=$ mass diffusivity.

## EQUIMOLAR COUNTER-DIFFUSION (GASES)

$\left(N_{B}=-N_{A}\right)$

$$
N_{A} / A=D_{m} /(\bar{R} T) \times\left[\left(p_{A 1}-p_{A 2}\right) /\left(z_{2}-z_{1}\right)\right]
$$

## Unsteady State Diffusion in a Gas

$$
\partial p_{A} / \partial t=D_{m}\left(\partial^{2} p_{A} / \partial z^{2}\right)
$$

## CONVECTION

## Two-Film Theory (for Equimolar Counter-Diffusion)

$$
\begin{aligned}
N_{A} / A & =k_{G}^{\prime}\left(p_{A G}-p_{A i}\right) \\
& =k_{L}^{\prime}\left(C_{A i}-C_{A L}\right) \\
& =K_{G}^{\prime}\left(p_{A G}-p_{A}{ }^{*}\right) \\
& =K_{L}^{\prime}\left(C_{A}^{*}-C_{A L}\right)
\end{aligned}
$$

where $p_{A}{ }^{*}$ is partial pressure in equilibrium with $C_{A L}$, and $C_{A}{ }^{*}=$ concentration in equilibrium with $p_{A G}$.

## Overall Coefficients

$$
\begin{aligned}
& 1 / K_{G}^{\prime}=1 / k_{G}^{\prime}+H / k_{L}^{\prime} \\
& 1 / K_{L}^{\prime}=1 / H k_{G}^{\prime}+1 / k_{L}^{\prime}
\end{aligned}
$$

## Dimensionless Group Equation (Sherwood)

For the turbulent flow inside a tube the Sherwood number

$$
\left(\frac{k_{m} D}{D_{m}}\right) \text { is given by: }\left(\frac{k_{m} D}{D_{m}}\right)=0.023\left(\frac{D \vee \rho}{\mu}\right)^{0.8}\left(\frac{\mu}{\rho D_{m}}\right)^{1 / 3}
$$

where,
$D=$ inside diameter,
$D_{m}=$ diffusion coefficient,
$V=$ average velocity in the tube,
$\rho=$ fluid density, and
$\mu=$ fluid viscosity.

## CIVIL ENGINEERING

## GEOTECHNICAL

## Definitions

c $=$ cohesion
$c_{c}=$ coefficient of curvature or gradation
$=\left(D_{30}\right)^{2} /\left[\left(D_{60}\right)\left(D_{10}\right)\right]$, where
$D_{10}, D_{30}, D_{60}=$ particle diameter corresponding to $10 \%$, $30 \%$, and $60 \%$ on grain-size curve.
$c_{u}=$ uniformity coefficient $=D_{60} / D_{10}$
$e \quad=$ void ratio $=V_{v} / V_{s}$, where
$V_{v}=$ volume of voids, and
$V_{s}=$ volume of the solids.
$K=$ coefficient of permeability $=$ hydraulic conductivity
$=Q /(i A)$ (from Darcy's equation), where
$Q=$ discharge,
$i=$ hydraulic gradient $=d H / d x$,
$H=$ hydraulic head,
$A=$ cross-sectional area.
$q_{u}=$ unconfined compressive strength $=2 c$
$w=$ water content $(\%)=\left(W_{w} / W_{s}\right) \times 100$, where
$W_{w}=$ weight of water, and
$W_{s}=$ weight of solids.
$C_{c}=$ compression index $=\Delta e / \Delta \log p$
$=\left(e_{1}-e_{2}\right) /\left(\log p_{2}-\log p_{1}\right)$, where
$e_{1}$ and $e_{2}=$ void ratio, and
$p_{1}$ and $p_{2}=$ pressure.
$D_{d}=$ relative density (\%)
$=\left[\left(e_{\max }-e\right) /\left(e_{\max }-e_{\min }\right)\right] \times 100$
$=\left[\left(1 / \gamma_{\text {min }}-1 / \gamma_{d}\right) /\left(1 / \gamma_{\text {min }}-1 / \gamma_{\max }\right)\right] \times 100$, where
$e_{\text {max }}$ and $e_{\text {min }}=$ maximum and minimum void ratio, and
$\gamma_{\max }$ and $\gamma_{\text {min }}=$ maximum and minimum unit dry weight.
$\mathrm{G}=$ specific gravity $=W_{s} /\left(V_{s} \gamma_{w}\right)$, where
$\gamma_{w}=$ unit weight of water.
$\Delta H=$ settlement $=H\left[C_{c} /\left(1+e_{i}\right)\right] \log \left[\left(p_{i}+\Delta p\right) / p_{i}\right]$
$=H \Delta e /\left(1+e_{i}\right)$, where
$H=$ thickness,
$\Delta e=$ change in void ratio, and
$p=$ pressure.
$P I=$ plasticity index $=L L-P L$, where
$L L=$ liquid limit, and
$P L=$ plasticity limit.
$S=$ degree of saturation $(\%)=\left(V_{w} / V_{v}\right) \times 100$, where
$V_{w}=$ volume of free water, and
$V_{v}=$ volume of voids.
$Q=K H\left(N_{f} / N_{d}\right)$ (for flow nets, $Q$ per unit width), where
$K=$ coefficient permeability,
$H=$ total hydraulic head (potential),
$N_{f}=$ number of flow tubes, and
$N_{d}=$ number of potential drips.
$\gamma=$ total unit weight of soil $=W / V$
$\gamma_{d}=$ dry unit weight of soil $=W_{s} / V$
$=G \gamma_{w} /(1+e)=\gamma /(1+w)$, where
$G=$ specific gravity of particles
$G w=S e$, where
$s=$ degree of saturation.
$e=$ void ratio
$\gamma_{s}=$ unit of weight of solids $=W_{s} / V_{s}$
$\eta=$ porosity $=V_{v} / V=e /(1+e)$
$\tau=$ general shear strength $=c+\sigma \tan \phi$, where
$\phi=$ angle of internal friction,
$\sigma=$ normal stress $=P / A$,
$P=$ force, and
$A=$ area.
$K_{a}=$ coefficient of active earth pressure
$=\tan ^{2}(45-\phi / 2)$
$K_{p}=$ coefficient of passive earth pressure
$=\tan ^{2}(45+\phi / 2)$
$P_{a}=$ active resultant force $=0.5 \gamma H^{2} K_{a}$, where
$H=$ height of wall.
$q_{\text {ult }}=$ bearing capacity equation
$=c N_{c}+\gamma D_{f} N_{q}+0.5 \gamma B N_{\gamma}$, where
$N_{c}, N_{q}$, and $N_{\gamma}=$ bearing capacity,
$B=$ width of strip footing, and
$D_{f}=$ depth of footing below surface.
$\mathrm{FS}=$ factor of safety (slope stability)
$=\frac{c L+W \cos \alpha \tan \phi}{W \sin \alpha}$, where
$L=$ length of slip plane,
$\alpha=$ slope of slip plane,
$\phi=$ angle of friction, and
$W=$ total weight of soil above slip plane.
$C_{v}=$ coefficient of consolidation $=T H^{2} / t$, where
$T=$ time factor,
$H=$ compression zone, and
$t=$ consolidation time .
$C_{c}=$ compression index for ordinary clay
$=0.009(L L-10)$
$\sigma^{\prime}=$ effective stress $=\sigma-u$, where
$\sigma=$ normal stress, and
$u=$ pore water pressure.

UNIFIED SOIL CLASSIFICATION SYSTEM (ASTM D-2487)

${ }^{\text {a }}$ Division of GM and SM groups into subdivisions of $d$ and $u$ are for roads and airfields only. Subdivision is based on Atterberg limits; suffix d used when LL is 28 or less and the PI is 6 or less; the suffix u used when LL is greater than 28.
${ }^{\text {b }}$ Borderline classification, used for soils possessing characteristics of two groups, are designated by combinations of group symbols. For example GW-GC, well-graded gravel-sand mixture with clay binder.

## STRUCTURAL ANALYSIS

## Influence Lines

An influence diagram shows the variation of a function (reaction, shear, bending moment) as a single unit load moves across the structure. An influence line is used to (1) determine the position of load where a maximum quantity will occur and (2) determine the maximum value of the quantity.

## Deflection of Trusses and Frames

Principle of virtual work as applied to deflection of trusses:

$$
\Delta=\Sigma F_{Q} \delta L, \text { where }
$$

for temperature:

$$
\delta L=\alpha L(\Delta T)
$$

and for load:

$$
\delta L=F_{p} L / A E
$$

Frames:

$$
\Delta=\Sigma\left\{\int m[M /(E I)] d x\right\}, \text { where }
$$

$F_{Q}=$ member force due to unit loads,
$F_{p}=$ member force due to external load,
$M=$ bending moment due to external loads, and
$m=$ bending moment due to unit load.

## BEAM FIXED-END MOMENT FORMULAS

$\mathrm{FEM}_{A B}=-\frac{P a b^{2}}{L^{2}}$
$\mathrm{FEM}_{A B}=-\frac{w_{o} L^{2}}{12}$
$\mathrm{FEM}_{A B}=-\frac{w_{o} L^{2}}{30}$

## REINFORCED CONCRETE DESIGN

Ultimate Strength Design

| ASTM Standard Reinforcing Bars |  |  |  |

Definitions
$A_{g}=$ gross cross-sectional area,
$A_{s}=$ area of tension steel,
$A_{v}=$ area of shear reinforcement within a distance $s$ along a member,
$b=$ width of section,
$b_{w}=$ width of web,
$\beta=$ ratio of depth of rectangular stress block to the depth to the neutral axis,

$$
=0.85 \geq 0.85-0.05\left(\frac{f_{c}^{\prime}-4,000}{1,000}\right) \geq 0.65
$$

$d=$ effective depth,
$E=$ modulus of elasticity of concrete,
$f_{c}^{\prime}=$ compressive stress of concrete,
$f_{y}=$ yield stress of steel,
$M_{n}=$ nominal moment (service moment * ultimate load factors),
$M_{u}=$ factored moment (nominal moment ${ }^{*}$ strength reduction factor),
$P_{n}=$ nominal axial load (with minimum eccentricity),
$P_{o}=$ nominal $P_{n}$ for axially loaded column,
$\rho=$ reinforcement ratio, tension steel,
$\rho_{b}=$ reinforcement ratio for balanced strain condition,
$s=$ spacing of shear reinforcement,
$V_{c}=$ nominal concrete shear strength,
$V_{s}=$ nominal shear strength provided by reinforcement, and
$V_{u}=$ factored shear force.

## Reinforcement Limits

$$
\begin{aligned}
& \rho \quad=A_{s} /(b d) \\
& \rho_{\min } \leq \rho \leq 0.75 \rho_{b} \\
& \rho_{\min } \geq \frac{3 \sqrt{f_{c}^{\prime}}}{f_{y}} \quad \text { or } \frac{200}{f_{y}} \\
& \rho_{b}=\frac{0.85 \beta f_{c}^{\prime}}{f_{y}}\left(\frac{87,000}{87,000+f_{y}}\right)
\end{aligned}
$$

## Moment Design

$$
\begin{aligned}
& \phi M_{n}=\phi 0.85 f_{c}^{\prime} a b(d-a / 2) \\
& \quad=\phi A_{s} f_{y}(d-a / 2) \\
& a=\frac{A_{s} f_{y}}{0.85 f_{c}^{\prime} b} \\
& M_{u}= \\
& \phi M_{n} \geq M_{u}
\end{aligned}
$$

## Shear Design

$$
\begin{aligned}
& \phi\left(V_{c}+V_{s}\right) \geq V_{u} \\
& V_{u}=1.4 V_{\text {Dead }}+1.7 V_{\text {Live }} \\
& V_{c}=2 \sqrt{f_{c}^{\prime}} b d \\
& V_{s}=A_{v} f_{y} d / s \\
& V_{s(\max )}=8 \sqrt{f_{c}^{\prime}} b d
\end{aligned}
$$

Minimum Shear Reinforcement

$$
\begin{aligned}
& A_{v}=50 b s / f_{y}, \text { when } \\
& V_{u}>\phi V_{c} / 2
\end{aligned}
$$

## Maximum Spacing for Stirrups

$$
\begin{aligned}
& \text { If } \mathrm{V}_{\mathrm{S}} \leq 4 \sqrt{f_{c}^{\prime}} \\
& s_{\max }=\min \left\{\begin{array}{l}
24 \text { inches } \\
d / 2
\end{array}\right\} \\
& \text { If } V_{s}>4 \sqrt{f_{c}^{\prime}} b d \\
& s_{\max }=\min \left\{\begin{array}{l}
12 \text { inches } \\
d / 4
\end{array}\right\}
\end{aligned}
$$

## T-Beams

## Effective Flange Width

$$
b_{e}=\min \left\{\begin{array}{l}
1 / 4 \times \text { span length } \\
b_{w}+16 \times \text { slab depth } \\
b_{w}+\text { clear span between beams }
\end{array}\right.
$$

## Moment Capacity

( $a>$ slab depth $)$

$$
\phi M_{n}=\phi\left[0.85 f_{c}^{\prime} h_{f}\left(b_{e}-b_{w}\right)\left(d-h_{f} / 2\right)+0.85 f_{c}^{\prime} a b_{w}(d-a / 2)\right]
$$

where
$h_{f}=$ slab depth, and
$b_{w}=$ web width.

## Columns

$$
\begin{aligned}
& \phi P_{n}>P_{u} \\
& P_{n}=0.8 P_{o} \quad \text { (tied) } \\
& P_{n}=0.85 P_{o} \quad \text { (spiral) } \\
& P_{o}=0.85 f_{c}^{\prime} A_{\text {concrete }}+f_{y} A_{s} \\
& A_{\text {concrete }}=A_{g}-A_{s}
\end{aligned}
$$

## Reinforcement Ratio

$$
\rho_{g}=A_{s} / A_{g}
$$

$$
0.01 \leq \rho_{g} \leq 0.08
$$

## STEEL DESIGN

## LOAD COMBINATIONS (LRFD)

Floor systems: 1.4D
Roof systems: $\quad 1.2 \mathrm{D}+1.6\left(\mathrm{~L}_{\mathrm{r}}\right.$ or S or R$)+0.8 \mathrm{~W}$
$1.2 \mathrm{D}+1.6 \mathrm{~L}$
$1.2 \mathrm{D}+0.5\left(\mathrm{~L}_{\mathrm{r}}\right.$ or S or R$)+1.3 \mathrm{~W}$
$0.9 \mathrm{D} \pm 1.3 \mathrm{~W}$
where: $\quad \mathrm{D}=$ dead load due to the weight of the structure and permanent features
$\mathrm{L}=$ live load due to occupancy and moveable equipment
$\mathrm{L}_{\mathrm{r}}=$ roof live load
$\mathrm{S}=$ snow load
$\mathrm{R}=$ load due to initial rainwater (excluding ponding) or ice
$\mathrm{W}=$ wind load
TENSION MEMBERS: flat plates, angles (bolted or welded)
Gross area: $A_{g}=b_{g} t$ (use tabulated value for angles)
Net area: $\quad A_{n}=\left(b_{g}-\Sigma D_{h}+\frac{s^{2}}{4 \mathrm{~g}}\right) t$
across critical chain of holes
where: $\quad b_{g}=$ gross width
$\mathrm{t}=$ thickness
$\mathrm{s}=$ longitudinal center-to-center spacing (pitch) of two consecutive holes
$\mathrm{g}=$ transverse center-to-center spacing (gage) between fastener gage lines
$\mathrm{D}_{\mathrm{h}}=$ bolt-hole diameter

Effective area (bolted members):
$A_{e}=U A_{n}\left\{\begin{array}{l}U=1.0 \text { (flat bars) } \\ U=0.85 \text { (angles with } \geq 3 \text { bolts in line) } \\ U=0.75 \text { (angles with } 2 \text { bolts in line) }\end{array}\right.$

## LRFD

Yielding: $\quad \phi T_{n}=\phi_{y} A_{g} F_{y}=0.9 A_{g} F_{y}$
Fracture: $\quad \phi T_{n}=\phi_{f} A_{e} F_{u}=0.75 A_{e} F_{u}$
Block shear rupture (bolted tension members):

$$
\begin{aligned}
& A_{g t}=\text { gross tension area } \\
& A_{g v}=\text { gross shear area } \\
& A_{n t}=\text { net tension area } \\
& A_{n v}=\text { net shear area }
\end{aligned}
$$

When $\quad F_{u} A_{n t} \geq 0.6 F_{u} A_{n v}$ :
$\phi R_{n}=0.75\left[0.6 F_{y} A_{g v}+F_{u} A_{n t}\right]$
When $\quad F_{u} A_{n t}<0.6 F_{u} A_{n v}$ :
$\phi R_{n}=0.75\left[0.6 F_{u} A_{n v}+F_{y} A_{g t}\right]$

Effective area (welded members):
$A_{e}=U A_{g}\left\{\begin{array}{l}U=1.0 \text { (flat bars, } L \geq 2 w \text { ) } \\ U=0.87 \text { (flat bars, } 2 w>L \geq 1.5 w \text { ) } \\ U=0.75 \text { (flat bars, } 1.5 w>L \geq w \text { ) } \\ U=0.85 \text { (angles) }\end{array}\right.$

## ASD

Yielding: $\quad T_{a}=A_{g} F_{t}=A_{g}\left(0.6 F_{y}\right)$
Fracture: $\quad T_{a}=A_{e} F_{t}=A_{e}\left(0.5 F_{u}\right)$
Block shear rupture (bolted tension members):

$$
\begin{aligned}
& T_{a}=\left(0.30 F_{u}\right) A_{n v}+\left(0.5 F_{u}\right) A_{n t} \\
& A_{n t}=\text { net tension area } \\
& A_{n v}=\text { net shear area }
\end{aligned}
$$

BEAMS: homogeneous beams, flexure about x -axis
Flexure - local buckling:
No local buckling if section is compact: $\quad \frac{b_{f}}{2 t_{f}} \leq \frac{65}{\sqrt{F_{y}}} \quad$ and $\quad \frac{h}{t_{w}} \leq \frac{640}{\sqrt{F_{y}}}$
where: $\quad$ For rolled sections, use tabulated values of $\frac{b_{f}}{2 t_{f}}$ and $\frac{h}{t_{w}}$
For built-up sections, $h$ is clear distance between flanges
For $\mathrm{F}_{\mathrm{y}} \leq 50 \mathrm{ksi}$, all rolled shapes except $\mathrm{W} 6 \times 19$ are compact.

Flexure - lateral-torsional buckling: $L_{b}=$ unbraced length

$$
\begin{aligned}
& \text { LRFD-compact rolled shapes } \\
& L_{p}=\frac{300 r_{y}}{\sqrt{F_{y}}} \\
& L_{r}=\frac{r_{y} X_{1}}{F_{L}} \sqrt{1+\sqrt{1+X_{2} F_{L}^{2}}} \\

## COLUMNS

## Column effective length $K L$ :

AISC Table C-C2.1 (LRFD and ASD)-Effective Length Factors (K) for Columns
AISC Figure C-C2.2 (LRFD and ASD)-Alignment Chart for Effective Length of Columns in Frames

## Column capacities

LRFD
Column slenderness parameter:
$\lambda_{\mathrm{c}}=\left(\frac{K L}{r}\right)_{\max }\left(\frac{1}{\pi} \sqrt{\frac{F_{y}}{E}}\right)$

Nominal capacity of axially loaded columns (doubly symmetric section, no local buckling):

$$
\begin{array}{ll}
\phi=0.85 & \\
\lambda_{\mathrm{c}} \leq 1.5: & \phi F_{c r}=\phi\left(0.658^{\lambda_{c}^{2}}\right) F_{y} \\
\lambda_{\mathrm{c}}>1.5: & \phi F_{c r}=\phi\left[\frac{0.877}{\lambda_{c}^{2}}\right] F_{y}
\end{array}
$$

See Table 3-50: Design Stress for Compression
Members ( $F_{y}=50$ ksi, $\phi=0.85$ )

## ASD

Column slenderness parameter:

$$
C_{c}=\sqrt{\frac{2 \pi^{2} E}{F_{y}}}
$$

Allowable stress for axially loaded columns (doubly symmetric section, no local buckling):

When $\left(\frac{K L}{r}\right)_{\text {max }} \leq C_{c}$

$$
F_{a}=\frac{\left[1-\frac{(K L / r)^{2}}{2 C_{c}{ }^{2}}\right] F_{y}}{\frac{5}{3}+\frac{3(K L / r)}{8 C_{c}}-\frac{(K L / \mathrm{r})^{3}}{8 C_{c}{ }^{3}}}
$$

When $\left(\frac{K L}{r}\right)_{\max }>C_{c}: \quad F_{a}=\frac{12 \pi^{2} E}{23(K L / r)^{2}}$
See Table C-50: Allowable Stress for Compression Members ( $F_{y}=50 \mathrm{ksi}$ )

Figure C-C.2.2.

## ALIGNMENT CHART FOR EFFECTIVE LENGTH OF COLUMNS IN CONTINUOUS FRAMES

The subscripts $A$ and $B$ refer to the joints at the two ends of the column section being considered. $G$ is defined as

$$
G=\frac{\Sigma\left(I_{c} / L_{c}\right)}{\Sigma\left(I_{g} / L_{g}\right)}
$$

in which $\Sigma$ indicates a summation of all members rigidly connected to that joint and lying on the plane in which buckling of the column is being considered. $I_{c}$ is the moment of inertia and $L_{c}$ the unsupported length of a column section, and $I_{g}$ is the moment of inertia and $L_{g}$ the unsupported length of a girder or other restraining member. $I_{c}$ and $I_{g}$ are taken about axes perpendicular to the plane of buckling being considered.

For column ends supported by but not rigidly connected to a footing or foundation, $G$ is theoretically infinity, but, unless actually designed as a true friction-free pin, may taken as "10" for practical designs. If the column end is rigidly attached to a properly designed footing, G may be taken as 1.0. Smaller values may be used if justified by analysis.

## ENVIRONMENTAL ENGINEERING

For information about environmental engineering refer to the ENVIRONMENTAL ENGINEERING section.

## HYDROLOGY

NRCS (SCS) Rainfall-Runoff

$$
\begin{aligned}
& Q=\frac{(P-0.2 S)^{2}}{P+0.8 S}, \\
& S=\frac{1,000}{C N}-10, \\
& C N=\frac{1,000}{S+10},
\end{aligned}
$$

$P=$ precipitation (inches),
$S=$ maximum basin retention (inches),
$Q=$ runoff (inches), and
$\mathrm{CN}=$ curve number.

## Rational Formula

$$
\begin{aligned}
& Q=C I A, \text { where } \\
& A= \\
& \text { watershed area (acres), } \\
& C=\text { runoff coefficient, } \\
& I=\text { rainfall intensity (in } / \mathrm{hr}), \text { and } \\
& Q=\text { discharge (cfs). }
\end{aligned}
$$

## DARCY'S EQUATION

$Q=-K A(d H / d x)$, where
$Q=$ Discharge rate ( $\mathrm{ft}^{3} / \mathrm{s}$ or $\mathrm{m}^{3} / \mathrm{s}$ ),
$K=$ Hydraulic conductivity ( $\mathrm{ft} / \mathrm{s}$ or $\mathrm{m} / \mathrm{s}$ ),
$H=$ Hydraulic head (ft or m), and
$A=$ Cross-sectional area of flow ( $\mathrm{ft}^{2}$ or $\mathrm{m}^{2}$ ).

SEWAGE FLOW RATIO CURVES

Population in thousands (P)
Curve $A_{2}: \frac{5}{P^{0.167}}$
Curve B: $\frac{14}{4+\sqrt{P}}+1 \quad$ Curve G: $\frac{18+\sqrt{P}}{4+\sqrt{P}}$

## HYDRAULIC-ELEMENTS GRAPH FOR CIRCULAR SEWERS

$$
\text { Values of: } \frac{f}{f_{f}} \text { and } \frac{\mathrm{n}}{\mathrm{n}_{f}}
$$

## Open-Channel Flow

Specific Energy

$$
E=\alpha \frac{V}{2 g}+y=\frac{\alpha Q^{2}}{2 g A^{2}}+y, \text { where }
$$

$E=$ specific energy,
$Q=$ discharge,
$V=$ velocity,
$y=$ depth of flow,
$A=$ cross-sectional area of flow, and
$\alpha=$ kinetic energy correction factor, usually 1.0.
Critical Depth $=$ that depth in a channel at minimum specific energy

$$
\frac{Q^{2}}{g}=\frac{A^{3}}{T}
$$

where $Q$ and $A$ are as defined above,
$g=$ acceleration due to gravity, and
$T=$ width of the water surface.

For rectangular channels

$$
y_{c}=\left(\frac{q^{2}}{g}\right)^{1 / 3}, \text { where }
$$

$y_{c}=$ critical depth,
$q=$ unit discharge $=Q / B$,
$B=$ channel width, and
$g=$ acceleration due to gravity.
Froude Number = ratio of inertial forces to gravity forces $F=\frac{V}{\sqrt{g y_{h}}}$, where
$V=$ velocity, and
$y_{h}=$ hydraulic depth $=A / T$

Specific Energy Diagram

$$
E=\frac{\alpha V^{2}}{2 g}+y
$$

Alternate depths - depths with the same specific energy.
Uniform Flow - a flow condition where depth and velocity do not change along a channel.

## Manning's Equation

$$
Q=\frac{K}{n} A R^{2 / 3} S^{1 / 2}
$$

$Q=$ discharge $\left(\mathrm{m}^{3} / \mathrm{s}\right.$ or $\left.\mathrm{ft}^{3} / \mathrm{s}\right)$,
$K=1.486$ for USCS units, 1.0 for SI units,
$A=$ cross-sectional area of flow $\left(\mathrm{m}^{2}\right.$ or $\left.\mathrm{ft}^{2}\right)$,
$R=$ hydraulic radius $=\mathrm{A} / \mathrm{P}$ ( m or ft ),
$P=$ wetted perimeter (m or ft),
$S=$ slope of hydraulic surface ( $\mathrm{m} / \mathrm{m}$ or $\mathrm{ft} / \mathrm{ft}$ ), and
$n=$ Manning's roughness coefficient.
Normal depth - the uniform flow depth

$$
A R^{2 / 3}=\frac{Q n}{K S^{1 / 2}}
$$

## Weir Formulas

Fully submerged with no side restrictions

$$
Q=C L H^{3 / 2}
$$

V-Notch

$$
Q=C H^{5 / 2} \text {, where }
$$

$Q=$ discharge ( cfs or $\mathrm{m}^{3} / \mathrm{s}$ ),
$C=3.33$ for submerged rectangular weir (USCS units),
$C=1.84$ for submerged rectangular weir (SI units),
$C=2.54$ for $90^{\circ} \mathrm{V}$-notch weir (USCS units),
$C=1.40$ for $90^{\circ} \mathrm{V}$-notch weir (SI units),
$L=$ Weir length (ft or m), and
$H=$ head (depth of discharge over weir) ft or m .

## Hazen-Williams Equation

$V=\mathrm{k}_{1} C R^{0.63} S^{0.54}$, where
$C=$ roughness coefficient,
$k_{1}=0.849$ for SI units, and
$k_{1}=1.318$ for USCS units,
$R=$ hydraulic radius ( ft or m ),
$S=$ slope of energy gradeline,
$=h_{f} / L(\mathrm{ft} / \mathrm{ft}$ or $\mathrm{m} / \mathrm{m})$, and
$V=$ velocity $(\mathrm{ft} / \mathrm{s}$ or $\mathrm{m} / \mathrm{s})$.

Values of Hazen-Williams Coefficient $C$

| Pipe Material | $C$ |
| :--- | :--- |
| Concrete (regardless of age) | 130 |
| Cast iron: |  |
| $\quad$ New | 130 |
| $\quad 5$ yr old | 120 |
| $\quad 20$ yr old | 100 |
| Welded steel, new | 120 |
| Wood stave (regardless of age) | 120 |
| Vitrified clay | 110 |
| Riveted steel, new | 110 |
| Brick sewers | 100 |
| Asbestos-cement | 140 |
| Plastic | 150 |

For additional fluids information, see the FLUID
MECHANICS section.

## TRANSPORTATION

## Stopping Sight Distance

$S=\frac{v^{2}}{2 g(f \pm G)}+T v$, where
$S=$ stopping sight distance (feet),
$v=$ initial speed (feet/second),
$g=$ acceleration of gravity,
$f=$ coefficient of friction between tires and roadway,
$G=$ grade of road (\%/100), and
$T=$ driver reaction time (second).

## Sight Distance Related to Curve Length

a. Crest-Vertical Curve:

$$
\begin{array}{ll}
L=\frac{A S^{2}}{100\left(\sqrt{2 h_{1}}+\sqrt{2 h_{2}}\right)^{2}} & \text { for } S<L \\
L=2 S-\frac{200\left(\sqrt{h_{1}}+\sqrt{h_{2}}\right)^{2}}{A} & \text { for } S>L
\end{array}
$$

where

$$
\begin{aligned}
& L=\text { length of vertical curve (feet) }, \\
& A=\text { algebraic difference in grades (\%), }, \\
& S=\text { sight distance (stopping or passing, feet) }, \\
& h_{1}=\text { height of drivers' eyes above the roadway surface } \\
& \text { (feet), and } \\
& h_{2}=\text { height of object above the roadway surface (feet). }
\end{aligned}
$$

When $h_{1}=3.50$ feet and $h_{2}=0.5$ feet,

$$
\begin{array}{ll}
L=\frac{A S^{2}}{1,329} & \text { for } S<L \\
L=2 S-\frac{1,329}{A} & \text { for } S>L
\end{array}
$$

b. Sag - Vertical Curve (standard headlight criteria):

$$
\begin{array}{ll}
L=\frac{A S^{2}}{400+3.5 S} & \text { for } S<L \\
L=2 S-\frac{400+3.5 S}{A} & \text { for } S>L
\end{array}
$$

c. Riding comfort (centrifugal acceleration) on sag vertical curve:
where $L=\frac{A V^{2}}{46.5}$,
$L=$ length of vertical curve (feet), and
$V=$ design speed (mph).
d. Adequate sight distance under an overhead structure to see an object beyond a sag vertical curve:

$$
\begin{array}{lr}
L=\frac{A S^{2}}{800}\left(C-\frac{h_{1}+h_{2}}{2}\right)^{-1} & \text { for } S< \\
L=2 S-\frac{800}{A}\left(C-\frac{h_{1}+h_{2}}{2}\right) & \text { for } S>L
\end{array}
$$

where

$$
\begin{aligned}
C= & \text { vertical clearance for overhead structure } \\
& \text { (underpass) located within } 200 \text { feet }(60 \mathrm{~m}) \text { of the } \\
& \text { midpoint of the curve. }
\end{aligned}
$$

e. Horizontal Curve (to see around an obstruction):
$M=\frac{5,729.58}{D}\left(1-\cos \frac{D S}{200}\right)$
$M=\frac{S^{2}}{8 R}$, where
$D=$ degree of curve,
$M=$ middle ordinate (feet),
$S=$ stopping sight distance (feet), and
$R=$ curve radius (feet).

## Superelevation of Horizontal Curves

a. Highways:

$$
e+f=\frac{v^{2}}{g R} \text {, where }
$$

$e=$ superelevation,
$f=$ side-friction factor,
$g=$ acceleration of gravity,
$v=$ speed of vehicle, and
$R=$ radius of curve (minimum).
b. Railroads:

$$
E=\frac{G v^{2}}{g R}, \text { where }
$$

$g=$ acceleration of gravity,
$v=$ speed of train,
$E=$ equilibrium elevation of the outer rail,
$G=$ effective gage (center-to-center of rails), and
$R=$ radius of curve.

## Spiral Transitions to Horizontal Curves

a. Highways:

$$
L_{s}=1.6 \frac{V^{3}}{R}
$$

b. Railroads:

$$
\begin{aligned}
L_{s} & =62 E \\
E & =0.0007 V^{2} D
\end{aligned}
$$

where

$$
\begin{aligned}
D & =\text { degree of curve }, \\
E & =\text { equilibrium elevation of outer rail (inches) }, \\
L_{s} & =\text { length of spiral (feet) }, \\
R & =\text { radius of curve (feet) }, \text { and } \\
V & =\text { speed (mph). }
\end{aligned}
$$

## Metric Stopping Sight Distance

$$
S=0.278 T V+\frac{V^{2}}{254(f \pm G)} \text {, where }
$$

$S=$ stopping sight distance (m),
$V=$ initial speed $\mathrm{km} / \mathrm{hr}$,
$G=$ grade of road (\%/100),
$T=$ driver reaction time (seconds), and
$f=$ coefficient of friction between tires and roadway.

## Highway Superelevation (metric)

$$
\frac{e}{100}+f=\frac{V^{2}}{127 R}, \text { where }
$$

$e=$ rate of roadway superelevation in \%,
$f=$ side friction factor,
$R=$ radius of curve (minimum) (m), and
$V=$ vehicle speed $(\mathrm{km} / \mathrm{hr})$.

## Highway Spiral Curve Length (metric)

$$
L_{s}=\frac{0.0702 V^{3}}{R C} \text {, where }
$$

$L_{s}=$ length of spiral (m),
$V=$ vehicle speed (km/hr),
$R=$ curve radius (m), and
$C=1$ to 3 , often used as 1 .

Sight Distance, Crest Vertical Curves (metric)

$$
\begin{array}{ll}
L=\frac{A S^{2}}{100\left(\sqrt{2 h_{1}}+\sqrt{2 h_{2}}\right)^{2}} & \text { For } S<L \\
L=2 S-\frac{200\left(\sqrt{h_{1}}+\sqrt{h_{2}}\right)^{2}}{A} & \text { For } S>L
\end{array}
$$

where
$L=$ length of vertical curve (m),
$S=$ sight distance (stopping or passing, m ),
$A=$ algebraic difference in grades $\%$,
$h_{1}=$ height of driver's eye above roadway surface (m), and
$h_{2}=$ height of object above roadway surface (m).
Sight Distance, Sag Vertical Curves (metric)

$$
\begin{array}{ll}
L=\frac{A S^{2}}{120+3.5 S} & \text { For } S<L \\
L=2 S-\left(\frac{120+3.5 S}{A}\right) & \text { For } S>L
\end{array}
$$

Both $1^{\circ}$ upward headlight illumination
Highway Sag Vertical Curve Criterion for Driver or Passenger Comfort (metric)

$$
L=\frac{A V^{2}}{395}, \text { where }
$$

$V=$ vehicle speed $(\mathrm{km} / \mathrm{hr})$.

## Modified Davis Equation - Railroads

$$
R=0.6+20 / W+0.01 V+K V^{2} /(W N)
$$

where
$K=$ air resistance coefficient,
$N=$ number of axles,
$R=$ level tangent resistance $[\mathrm{lb} /$ (ton of car weight $)]$,
$V=$ train or car speed (mph), and
$W=$ average load per axle (tons).
Standard values of $K$
$K=0.0935$, containers on flat car,
$K=0.16$, trucks or trailers on flat car, and
$K=0.07$, all other standard rail units.

Railroad curve resistance is 0.8 lb per ton of car weight per degree of curvature.
$T E=375(\mathrm{HP}) e / V$, where
$e=$ efficiency of diesel-electric drive system ( 0.82 to $0.93)$,
HP $=$ rated horsepower of a diesel-electric locomotive unit,
$T E=$ tractive effort (lb force of a locomotive unit), and
$V=$ locomotive speed (mph).

## AREA Vertical Curve Criteria for Track Profile

Maximum Rate of Change of Gradient in Percent Grade per Station

| Line Rating | In <br> Sags | On <br> Crests |
| :--- | :---: | :---: |
| High-speed Main Line Tracks | 0.05 | 0.10 |
| Secondary or Branch Line Tracks | 0.10 | 0.20 |

## Transportation Models

Optimization models and methods, including queueing theory, can be found in the INDUSTRIAL ENGINEERING section.
Traffic Flow Relationships ( $q=k v$ )

AIRPORT LAYOUT AND DESIGN

1. Cross-wind component of 12 mph maximum for aircraft of $12,500 \mathrm{lb}$ or less weight and 15 mph maximum for aircraft weighing more than $12,500 \mathrm{lb}$.
2. Cross-wind components maximum shall not be exceeded more than $5 \%$ of the time at an airport having a single runway.
3. A cross-wind runway is to be provided if a single runway does not provide $95 \%$ wind coverage with less than the maximum cross-wind component.

## LONGITUDINAL GRADE DESIGN CRITERIA FOR RUNWAYS

| Item | Transport Airports | Utility Airports |
| :--- | :---: | :---: |
| Maximum longitudinal grade (percent) | 1.5 | 2.0 |
| Maximum grade change such as $A$ or $B$ (percent) | 1.5 | 2.0 |
| Maximum grade, first and last quarter of runway (percent) | 0.8 | ---- |
| Minimum distance (D, feet) between PI's for vertical curves | $1,000(A+B)^{a}$ | $250(A+B)^{a}$ |
| Minimum length of vertical curve (L, feet) per 1 percent grade change | 1,000 | 300 |
|  |  |  |
| Use absolute values of $A$ and $B$ (percent). |  |  |

## AUTOMOBILE PAVEMENT DESIGN

## AASHTO Structural Number Equation

$$
S N=a_{1} D_{1}+a_{2} \mathrm{D}_{2}+\ldots+a_{n} D_{n}, \text { where }
$$

$S N=$ structural number for the pavement
$a_{i} \quad=$ layer coefficient and $\mathrm{D}_{\mathrm{i}}=$ thickness of layer (inches).

## EARTHWORK FORMULAS

Average End Area Formula, $\mathrm{V}=\mathrm{L}\left(\mathrm{A}_{1}+\mathrm{A}_{2}\right) / 2$,
Prismoidal Formula, $\mathrm{V}=\mathrm{L}\left(\mathrm{A}_{1}+4 \mathrm{~A}_{\mathrm{m}}+\mathrm{A}_{2}\right) / 6$, where $\mathrm{A}_{\mathrm{m}}=$ area of mid-section
Pyramid or Cone, $\mathrm{V}=\mathrm{h}($ Area of Base) $/ 3$,

## AREA FORMULAS

Area by Coordinates: Area $=\left[\mathrm{X}_{\mathrm{A}}\left(\mathrm{Y}_{\mathrm{B}}-\mathrm{Y}_{\mathrm{N}}\right)+\mathrm{X}_{\mathrm{B}}\left(\mathrm{Y}_{\mathrm{C}}-\mathrm{Y}_{\mathrm{A}}\right)+\mathrm{X}_{\mathrm{C}}\left(\mathrm{Y}_{\mathrm{D}}-\mathrm{Y}_{\mathrm{B}}\right)+\ldots+\mathrm{X}_{\mathrm{N}}\left(\mathrm{Y}_{\mathrm{A}}-\mathrm{Y}_{\mathrm{N}-1}\right)\right] / 2$,

Trapezoidal Rule: Area $=w\left(\frac{h_{1}+h_{n}}{2}+h_{2}+h_{3}+h_{4}+\ldots+h_{n-1}\right) \quad w=$ common interval,

Simpson's $1 / 3$ Rule: Area $=w\left[h_{1}+2\left(\sum_{k=3,5, \ldots}^{n-2} h_{k}\right)+4\left(\sum_{k=2,4, \ldots}^{n-1} h_{k}\right)+h_{n}\right] / 3 \quad n$ must be odd number of measurements, $w=$ common interval

## CONSTRUCTION

Construction project scheduling and analysis questions may be based on either activity-on-node method or on activity-on-arrow method.

## CPM PRECEDENCE RELATIONSHIPS (ACTIVITY ON NODE)

Start-to-start: start of B depends on the start of A

Finish-to-finish: finish of B depends on the finish of A

Finish-to-start: start of B depends on the finish of A

## VERTICAL CURVE FORMULAS

$L \quad=$ Length of Curve (horizontal)
$P V C=$ Point of Vertical Curvature
$P V I=$ Point of Vertical Intersection
$P V T=$ Point of Vertical Tangency
$g_{1} \quad=$ Grade of Back Tangent
$x \quad=$ Horizontal Distance from PVC
(or point of tangency) to Point on Curve
$x_{m}=$ Horizontal Distance to Min/Max Elevation on Curve $=-\frac{g_{1}}{2 a}=\frac{g_{1} L}{g_{1}-g_{2}}$

Tangent Elevation $=Y_{\mathrm{PVC}}+g_{1} x \quad$ and $\quad=Y_{\mathrm{PVI}}+g_{2}(x-L / 2)$
Curve Elevation $=Y_{\mathrm{PVC}}+g_{1} x+a x^{2}=Y_{\mathrm{PVC}}+g_{1} x+\left[\left(g_{2}-g_{1}\right) /(2 L)\right] x^{2}$

$$
\begin{array}{ll}
y=a x^{2} ; & a=\frac{\mathrm{g}_{2}-g_{1}}{2 L} ; \\
E=a\left(\frac{L}{2}\right)^{2} ; & r=\frac{g_{2}-g_{1}}{L}
\end{array}
$$

## HORIZONTAL CURVE FORMULAS

D = Degree of Curve, Arc Definition
P.C. $=$ Point of Curve (also called B.C.)
P.T. = Point of Tangent (also called E.C.)
P.I. $=$ Point of Intersection

I $\quad=$ Intersection Angle (also called $\Delta$ )
Angle between two tangents
$\mathrm{L}=$ Length of Curve,
from P.C. to P.T.
$\mathrm{T}=$ Tangent Distance
E = External Distance
$\mathrm{R}=$ Radius
L.C. $=$ Length of Long Chord
$\mathrm{M}=$ Length of Middle Ordinate
c $\quad=$ Length of Sub-Chord
$\mathrm{d}=$ Angle of Sub-Chord

$$
\begin{aligned}
& R=\frac{L . C .}{2 \sin (I / 2)} ; \quad T=R \tan (I / 2)=\frac{L . C .}{2 \cos (I / 2)} \\
& R=\frac{5729.58}{D} ; \quad L=R I \frac{\pi}{180}=\frac{I}{D} 100 \\
& M=R[1-\cos (I / 2)] \\
& \frac{R}{E+R}=\cos (I / 2) ; \quad \frac{R-M}{R}=\cos (I / 2) \\
& c=2 R \sin (d / 2) ; \\
& E=R\left[\frac{1}{\cos (I / 2)}-1\right]
\end{aligned}
$$

Deflection angle per 100 feet of arc length equals $D / 2$

## ENVIRONMENTAL ENGINEERING

## PLANNING

## Population Projection Equations

## $\underline{\text { Linear Projection }=\text { Algebraic Projection }}$

$$
P_{T}=P_{0}+k \Delta t, \text { where }
$$

$P_{T}=$ population at time T,
$P_{0}=$ population at time zero (fitting parameter),
$k=$ growth rate (fitting parameter), and
$\Delta t=$ elapsed time in years relative to time zero.
$\underline{\text { Log Growth }=\text { Exponential Growth }=\text { Geometric Growth }}$

$$
P_{T}=P_{0} \mathrm{e}^{\mathrm{k} \Delta \mathrm{t}}
$$

$\ln P_{T}=\ln P_{0}+k \Delta t$, where
$P_{T}=$ population at time $T$,
$P_{0}=$ population at time zero (fitting parameter),
$k=$ growth rate (fitting parameter), and
$\Delta t=$ elapsed time in years relative to time zero.

## WATER

For information about fluids, refer to the CIVIL ENGINEERING and FLUID MECHANICS sections.
For information about hydrology and geohydrology, refer to the CIVIL ENGINEERING section.

Stream Modeling: Streeter Phelps

$$
D=\frac{k_{d} S_{o}}{k_{a}-k_{d}}\left[\exp \left(-k_{d} t\right)-\exp \left(-k_{a} t\right)\right]+D_{o} \exp \left(-k_{a} t\right)
$$

$$
t_{c}=\frac{1}{k_{a}-k_{d}} \ln \left[\frac{k_{a}}{k_{d}}\left(1-D_{o} \frac{\left(k_{a}-k_{d}\right)}{k_{d} S_{o}}\right)\right]
$$

$\mathrm{D}=\mathrm{DO}_{\text {sat }}-\mathrm{DO}$, where
$D=$ dissolved oxygen deficit ( $\mathrm{mg} / \mathrm{L}$ ),
$k_{d}=$ deoxygenation rate constant, base e, days $^{-1}$,
$t=$ time, days,
$k_{a}=$ reaeration rate, base e, days ${ }^{-1}$,
$S_{o}=$ initial BOD ultimate in mixing zone, $\mathrm{mg} / \mathrm{L}$,
$D_{o}=$ initial dissolved oxygen deficit in mixing zone ( $\mathrm{mg} / \mathrm{L}$ ),
$t_{c}=$ time which corresponds with minimum dissolved oxygen (mg/L),
$D O_{\text {sat }}=$ saturated dissolved oxygen concentration (mg/L), and
$D O=$ dissolved oxygen concentration (mg/L).

WATER AND WASTEWATER TECHNOLOGIES
For information about reactor design (batch, plug flow, and complete mix), refer to the CHEMICAL ENGINEERING section.

Approach velocity $=$ horizontal velocity $=Q / A_{x}$,
Hydraulic loading rate $=Q / A$, and
Hydraulic residence time $=V / Q=\theta$.
where
$Q=$ flow rate,
$A_{x}=$ cross-sectional area,
$A=$ surface area, plan view, and
$V=$ tank volume.

## Lime-Soda Softening Equations

$50 \mathrm{mg} / \mathrm{L}$ as $\mathrm{CaCO}_{3}$ equivalent $=1 \mathrm{meq} / \mathrm{L}$

1. Carbon dioxide removal

$$
\mathrm{CO}_{2}+\mathrm{Ca}(\mathrm{OH})_{2} \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}
$$

2. Calcium carbonate hardness removal

$$
\mathrm{Ca}\left(\mathrm{HCO}_{3}\right)_{2}+\mathrm{Ca}(\mathrm{OH})_{2} \rightarrow 2 \mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}
$$

3. Calcium non-carbonate hardness removal

$$
\mathrm{CaSO}_{4}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})+2 \mathrm{Na}^{+}+\mathrm{SO}_{4}^{-2}
$$

4. Magnesium carbonate hardness removal

$$
\begin{gathered}
\mathrm{Mg}\left(\mathrm{HCO}_{3}\right)_{2}+2 \mathrm{Ca}(\mathrm{OH})_{2} \rightarrow 2 \mathrm{CaCO}_{3}(\mathrm{~s})+ \\
\mathrm{Mg}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O}
\end{gathered}
$$

5. Magnesium non-carbonate hardness removal

$$
\begin{gathered}
\mathrm{MgSO}_{4}+ \\
\mathrm{Ca}(\mathrm{OH})_{2}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})+ \\
\mathrm{Mg}(\mathrm{OH})_{2}(\mathrm{~s})+2 \mathrm{Na}^{+}+\mathrm{SO}_{4}^{2-}
\end{gathered}
$$

6. Destruction of excess alkalinity

$$
2 \mathrm{HCO}_{3}^{-}+\mathrm{Ca}(\mathrm{OH})_{2} \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{CO}_{3}^{2-}+2 \mathrm{H}_{2} \mathrm{O}
$$

7. Recarbonation

$$
\mathrm{Ca}^{2+}+2 \mathrm{OH}^{-}+\mathrm{CO}_{2} \rightarrow \mathrm{CaCO}_{3}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}
$$

## Rapid Mix and Flocculator Design

$$
G=\sqrt{\frac{P}{\mu V}}=\sqrt{\frac{\gamma H_{L}}{t \mu}}
$$

$G t=10^{4}-10^{5}$
where
$G=$ mixing intensity $=$ root mean square velocity gradient,
$P=$ power,
$V=$ volume,
$\mu=$ bulk viscosity,
$\gamma=$ specific weight of water,
$H_{L}=$ head loss in mixing zone, and
$t=$ time in mixing zone.
Reel and Paddle
$P_{\mathrm{BOARD}}=\frac{C_{D} A_{P} \rho_{f} v_{p}^{3}}{2}$, where
$C_{D}=$ drag coefficient $=1.8$ for flat blade with a
$\mathrm{L}: \mathrm{W}>20: 1$,
$A_{p}=$ area of blade $\left(\mathrm{m}^{2}\right)$ perpendicular to the direction of travel through the water,
$\rho_{\mathrm{f}}=$ density of $\mathrm{H}_{2} \mathrm{O}\left(\mathrm{kg} / \mathrm{m}^{3}\right)$,
$v_{p}=$ relative velocity of paddle ( $\mathrm{m} / \mathrm{sec}$ ), and
$v=v_{\text {actual }}$ - slip coefficient.
slip coefficient $=0.5-0.75$.

## Turbulent Flow Impeller Mixer

$$
P=K_{T}(n)^{3}\left(D_{i}\right)^{5} \rho_{\mathrm{f}}, \text { where }
$$

$K_{T}=$ impeller constant (see table),
$n=$ rotational speed (rev/sec), and
$D_{i}=$ impeller diameter (m).
Values of the Impeller Constant $K_{T}$ (Assume Turbulent Flow)

| Type of Impeller |  |
| :--- | :---: |
| Propeller, pitch of 1, 3 blades | $K_{T}$ |
| Propeller, pitch of 2, 3 blades | 0.32 |
| Turbine, 6 flat blades, vaned disc | 1.00 |
| Turbine, 6 curved blades | 6.30 |
| Fan turbine, 6 blades at 45 | 4.80 |
| Shrouded turbine, 6 curved blades | 1.65 |
| Shrouded turbine, with stator, no <br> baffles | 1.08 |
| Note: Constant assumes baffled tanks having four baffles at the tank |  |
| wall with a width equal to 10\% of the tank diameter. |  |

## Settling Equations

## General Spherical

$$
\mathrm{v}_{t}=\sqrt{\frac{4 / 3 g\left(\rho_{p}-\rho_{f}\right) d}{C_{D} \rho_{f}}}
$$

$$
C_{D}=24 / \operatorname{Re} \quad(\text { Laminar } ; \operatorname{Re} \leq 1.0)
$$

$$
=24 / \operatorname{Re}^{+}+3 /(\operatorname{Re})^{1 / 2}+0.34 \quad \text { (Transitional) }
$$

$$
=0.4\left(\text { Turbulent } ; R e \geq 10^{4}\right)
$$

$$
R e=\text { Reynolds number }=\frac{v_{t} \rho d}{\mu}, \text { where }
$$

$g=$ gravitational constant,
$\rho_{p}$ and $\rho_{f}=$ density of particle and fluid respectively,
$d=$ diameter of sphere,
$C_{D}=$ spherical drag coefficient,
$\mu=$ bulk viscosity of liquid $=$ absolute viscosity, and
$v_{t}=$ terminal settling velocity.

## Stokes' Law

$$
\mathrm{v}_{t}=\frac{g\left(\rho_{p}-\rho_{f}\right) d^{2}}{18 \mu}
$$

## Filtration Equations

Effective size $=d_{10}$
Uniformity coefficient $=d_{60} / d_{10}$
$d_{x}=$ diameter of particle class for which $x \%$ of sample is less than (units meters or feet).

## Head Loss Through Clean Bed

Rose Equation
Monosized Media Multisized Media
$h_{f}=\frac{1.067\left(V_{s}\right)^{2} L C_{D}}{g \eta^{4} d} \quad h_{f}=\frac{1.067\left(V_{s}\right)^{2} L}{g \eta^{4}} \sum \frac{C_{D_{i j}} x_{i j}}{d_{i j}}$

## Carmen-Kozeny Equation

Monosized Media

## Multisized Media

$h_{f}=\frac{f^{\prime} L(1-\eta) V_{s}^{2}}{\eta^{3} g d_{p}} \quad h_{f}=\frac{L(1-\eta) V_{s}^{2}}{\eta^{3} g} \sum \frac{f_{i j}^{\prime} x_{i j}}{d_{i j}}$
$f^{\prime}=$ friction factor $=150\left(\frac{1-\eta}{R e}\right)+1.75$, where
$h_{f}=$ head loss through the cleaner bed $\left(\mathrm{m}\right.$ of $\left.\mathrm{H}_{2} \mathrm{O}\right)$,
$L=$ depth of filter media (m),
$\eta=$ porosity of bed $=$ void volume/total volume,
$V_{s}=$ filtration rate $=$ empty bed approach velocity $=$ $Q / A_{\text {plan }}(\mathrm{m} / \mathrm{s})$, and
$g=$ gravitational acceleration $\left(\mathrm{m} / \mathrm{s}^{2}\right)$.
$R e=$ Reynolds number $=\frac{V_{s} \rho d}{\mu}$
$d_{i j}, d_{p}, d=$ diameter of filter media particles; arithmetic average of adjacent screen openings (m); $i=$ filter media (sand, anthracite, garnet); $j=$ filter media particle size,
$x_{i j}=$ mass fraction of media retained between adjacent sieves,
$f_{i j}^{\prime}=$ friction factors for each media fraction, and
$C_{D}=$ drag coefficient as defined in settling velocity equations.
Bed Expansion
Monosized
Multisized
$L_{f b}=\frac{L_{o}\left(1-\eta_{o}\right)}{1-\left(\frac{V_{B}}{V_{t}}\right)^{0.22}} \quad L_{f b}=L_{o}\left(1-\eta_{o}\right) \sum \frac{x_{i j}}{1-\left(\frac{V_{B}}{V_{t, i, j}}\right)^{0.22}}$
$\eta_{f b}=\left(\frac{V_{B}}{V_{t}}\right)^{0.22}$, where
$L_{f b}=$ depth of fluidized filter media (m),
$V_{B}=$ backwash velocity (m/s), $Q / A_{\text {plan }}$,
$V_{t}=$ terminal setting velocity, and
$\eta_{f b}=$ porosity of fluidized bed.
$L_{o}=$ initial bed depth
$\eta_{o}=$ initial bed porosity

## Clarifier

Overflow rate $\quad=\mathrm{v}_{o}=Q / A_{\text {surface }}$
Weir overflow rate $=$ WOR $=Q /$ Weir Length

| 1. Intermediate and final clarifiers |  |  |
| Activated sludge |  |  |
| Chemical precipitation |  |  |

## Weir Loadings

1. Water Treatment-weir overflow rates should not exceed $20,000 \mathrm{gpd} / \mathrm{ft}$
2. Wastewater Treatment
a. Flow $\leq 1$ MGD: weir overflow rates should not exceed $10,000 \mathrm{gpd} / \mathrm{ft}$
b. Flow > 1 MGD: weir overflow rates should not exceed $15,000 \mathrm{gpd} / \mathrm{ft}$

## Horizontal Velocities

1. Water Treatment-horizontal velocities should not exceed 0.5 fpm
2. Wastewater Treatment-no specific requirements (use the same criteria as for water)

## Dimensions

1. Rectangular tanks
a. Length:Width ratio $=3: 1$ to $5: 1$
b. Basin width is determined by the scraper width (or multiples of the scraper width)
c. Bottom slope is set at $1 \%$
d. Minimum depth is 10 ft
2. Circular Tanks
a. Diameters up to 200 ft
b. Diameters must match the dimensions of the sludge scraping mechanism
c. Bottom slope is less than $8 \%$
d. Minimum depth is 10 ft

Length:Width Ratio
Clarifier
3:1 to 5:1
Filter bay
1.2:1 to $1.5: 1$

Chlorine contact chamber

$$
20: 1 \text { to } 50: 1
$$

## Activated Carbon Adsorption

Freundlich Isotherm

|  | $\frac{x}{m}=X=K C_{e}^{1 / n}$, where |
| ---: | :--- |
| $x=$ | mass of solute adsorbed,, |
| $m=$ | mass of adsorbent, |
| $X=$ | mass ratio of the solid phase-that is, the mass of <br> adsorbed solute per mass of adsorbent, |
| $C_{e}=$ | equilibrium concentration of solute, mass/volume, <br> and |
| $K, n=$ | experimental constants. |

## Linearized Form

$$
\ln \frac{x}{m}=1 / n \ln C_{e}+\ln K
$$

For linear isotherm, $\mathrm{n}=1$

## Langmuir Isotherm

$$
\frac{x}{m}=X=\frac{a K C_{e}}{1+K C_{e}} \text {, where }
$$

$a=$ mass of adsorbed solute required to saturate completely a unit mass of adsorbent, and
$K=$ experimental constant.
Linearized Form

$$
\frac{m}{x}=\frac{1}{a}+\frac{1}{a K} \frac{1}{C_{e}}
$$

Depth of Sorption Zone
$Z_{s}=Z\left[\frac{V_{Z}}{V_{T}-0.5 V_{Z}}\right]$, where
$V_{Z}=V_{T}-V_{B}$
$Z_{S}=$ depth of sorption zone,
$Z=$ total carbon depth,
$V_{T}=$ total volume treated at exhaustion ( $C=0.95 C_{o}$ ),
$V_{B}=$ total volume at breakthrough ( $C=C_{\alpha}=$ $0.05 C_{o}$ ), and
$C_{o}=$ concentration of
 contaminant in influent.

## Reverse Osmosis

Osmotic Pressure of Solutions of Electrolytes

$$
\pi=\phi \nu \frac{n}{V} R T \text {, where }
$$

$\pi=$ osmotic pressure,
$\phi=$ osmotic coefficient,
$v=$ number of ions formed from one molecule of electrolyte,
$n=$ number of moles of electrolyte,
$V=$ volume of solvent,
$R=$ universal gas constant, and
$T=$ absolute pressure.

A CONTINUOUS-FLOW REVERSE OSMOSIS UNIT

## Water Flux

$J_{w}=W_{p} \times(\Delta P-\Delta \pi)$, where
$J_{w}=$ water flux through the membrane $\left[\mathrm{gmol} /\left(\mathrm{cm}^{2} \cdot \mathrm{~s}\right)\right]$,
$W_{p}=$ coefficient of water permeation, a characteristic of the particular membrane $\left[\mathrm{gmol} /\left(\mathrm{cm}^{2} \cdot \mathrm{~s} \cdot \mathrm{~atm}\right)\right]$,
$\Delta P=$ pressure differential across membrane $=P_{\text {in }}-P_{\text {out }}$ (atm), and
$\Delta \pi=$ osmotic pressure differential across membrane $\pi_{\text {in }}-\pi_{\text {out }}(\mathrm{atm})$.
Salt Flux through the Membrane
$J_{s}=\left(D_{s} K_{s} / \Delta Z\right)\left(C_{\text {in }}-C_{\text {out }}\right)$, where
$J_{s}=$ salt flux through the membrane $\left[\mathrm{gmol} /\left(\mathrm{cm}^{2} \cdot \mathrm{~s}\right)\right]$,
$D_{s}=$ diffusivity of the solute in the membrane $\left(\mathrm{cm}^{2} / \mathrm{s}\right)$,
$K_{s}=$ solute distribution coefficient (dimensionless),
$C=$ concentration ( $\mathrm{gmol} / \mathrm{cm}^{3}$ ),
$\Delta Z=$ membrane thickness (cm), and
$J_{s}=K_{p} \times\left(C_{\text {in }}-C_{\text {out }}\right)$
$K_{p}=$ membrane solute mass transfer coefficient $=$ $D_{s} K_{s} / \Delta Z(\mathrm{~L} / \mathrm{t}, \mathrm{cm} / \mathrm{s})$.

## Ultrafiltration

$J_{w}=\frac{\varepsilon r^{2} \int \Delta P}{8 \mu \delta}$, where
$\varepsilon=$ membrane porosity,
$r=$ membrane pore size,
$\Delta P=$ net transmembrane pressure,
$\mu=$ viscosity,
$\delta=$ membrane thickness, and
$J_{w}=$ volumetric flux (m/s).

## Electrodialysis

In $n$ Cells, the Required Current Is:

$$
I=(F Q N / n) \times\left(E_{1} / E_{2}\right) \text {, where }
$$

$I=$ current (amperes),
$F=$ Faraday's constant $=96,487 \mathrm{C} / \mathrm{g}$-equivalent,
$Q=$ flow rate ( $\mathrm{L} / \mathrm{s}$ ),
$N=$ normality of solution (g-equivalent/L),
$n=$ number of cells between electrodes,
$E_{1}=$ removal efficiency (fraction), and
$E_{2}=$ current efficiency (fraction).
Voltage
$E=I R$, where
$E=$ voltage requirement (volts), and
$R=$ resistance through the unit (ohms).

## Required Power

$P=I^{2} R$ (watts)

where
$A_{\text {out }}=$ concentration in the effluent air,
$H=$ Henry's Law constant,
$H^{\prime}=H / R T=$ dimensionless Henry's Law constant,
$R=$ universal gas constant,
$Q_{W}=$ water flow rate $\left(\mathrm{m}^{3} / \mathrm{s}\right)$,
$Q_{A}=$ air flow rate ( $\mathrm{m}^{3} / \mathrm{s}$ ),
$A=$ concentration of contaminant in air $\left(\mathrm{kmol} / \mathrm{m}^{3}\right)$, and
$C=$ concentration of contaminants in water $\left(\mathrm{kmol} / \mathrm{m}^{3}\right)$.
$\underline{\text { Stripper Packing Height }=Z}$
$Z=\mathrm{HTU} \times \mathrm{NTU}$
$\mathrm{NTU}=\left(\frac{R}{R-1}\right) \ln \left(\frac{\left(C_{\text {in }} / C_{\text {out }}\right)(R-1)+1}{R}\right)$
NTU $=$ number of transfer units
where
$R=$ stripping factor $H^{\prime}\left(Q_{A} / Q_{W}\right)$ (dimensionless),
$C_{\text {in }}=$ concentration in the effluent water $\left(\mathrm{kmol} / \mathrm{m}^{3}\right)$, and
$C_{\text {out }}=$ concentration in the effluent water $\left(\mathrm{kmol} / \mathrm{m}^{3}\right)$.
$\mathrm{HTU}=$ Height of Transfer Units $=\frac{L}{M_{W} K_{L} a}$, where
$L=$ liquid molar loading rate $\left[\mathrm{kmol} /\left(\mathrm{s} \cdot \mathrm{m}^{2}\right)\right]$,
$M_{W}=$ molar density of water $\left(55.6 \mathrm{kmol} / \mathrm{m}^{3}\right)=3.47$ $\mathrm{lbmol} / \mathrm{ft}^{3}$, and
$K_{L} a=$ overall transfer rate constant $\left(\mathrm{s}^{-1}\right)$.

## Environmental Microbiology

BOD Exertion

$$
y_{t}=L\left(1-e^{-k t}\right)
$$

where
$k=$ reaction rate constant (base $e$, days $^{-1}$ ),
$L=$ ultimate BOD (mg/L),
$t=$ time (days), and
$y_{t}=$ the amount of BOD exerted at time $t(\mathrm{mg} / \mathrm{L})$.

## Monod Kinetics

$\mu=\mu_{\max } \frac{S}{K_{x}+S}$, where
$\mu=$ specific growth rate (time ${ }^{-1}$ ),
$\mu_{\max }=$ maximum specific growth rate (time ${ }^{-1}$ ),
$S=$ concentration of substrate in solution (mass/unit volume), and
$K_{s} \quad=$ half-velocity constant $=$ half-saturation constant (i.e., substrate concentration at which the specific growth rate is one-half $\mu_{\max }$ ) (mass/unit volume).
Half-Life of a Biologically Degraded Contaminant
Assuming First-Order Rate Constant

$$
k=\frac{0.693}{t_{1 / 2}}, \text { where }
$$

$t_{1 / 2}=$ half-life (days).

## Activated Sludge

$$
X_{A}=\frac{\theta_{c} Y\left(S_{o}-S_{e}\right)}{\theta\left(1+k_{d} \theta_{c}\right)}, \text { where }
$$

$X_{A}=$ biomass concentration in aeration tank (MLSS or MLVSS kg/m ${ }^{3}$ );
$S_{o}=$ influent BOD or COD concentration $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$;
$S_{e}=$ effluent BOD or COD concentration ( $\mathrm{kg} / \mathrm{m}^{3}$ );
$k_{d}=$ microbial death ratio; kinetic constant; day ${ }^{-1}$; typical range $0.1-0.01$, typical domestic wastewater value $=0.05 \mathrm{day}^{-1}$;
$Y=$ yield coefficient Kg biomass $/ \mathrm{Kg}$ BOD consumed; range 0.4-1.2; and
$\theta=$ hydraulic residence time .
$\theta_{\mathrm{c}}=$ Solids residence time $=\frac{V_{A} X_{A}}{Q_{w} X_{w}+Q_{e} X_{e}}$
Sludge flow rate : $Q_{s}=\frac{M(100)}{\rho_{s}(\% \text { solids })}$
Solids loading rate $=Q X / A$
For activated sludge secondary clarifier $Q=Q_{\mathrm{o}}+Q_{R}$
Organic loading rate $($ volumetric $)=Q_{o} S_{o} / V$
Organic loading rate (F:M) $=Q_{o} S_{o} /\left(V_{A} X_{A}\right)$
Organic loading rate $($ surface area $)=Q_{o} S_{o} / A_{M}$
$\mathrm{SVI}=\frac{\text { Sludge volume after settling }(\mathrm{mL} / \mathrm{L}) * 1,000}{\mathrm{MLSS}(\mathrm{mg} / \mathrm{L})}$
Steady State Mass Balance for Secondary Clarifier:

$$
\left(Q_{\mathrm{o}}+\mathrm{Q}_{R}\right) X_{A}=Q_{e} X_{e}+\mathrm{Q}_{R} X_{w}+Q_{w} X_{w}
$$

$A=$ surface area of unit,
$A_{M}=$ surface area of media in fixed-film reactor,
$A_{x}=$ cross-sectional area of channel,
$M=$ sludge production rate (dry weight basis),
$Q_{o}=$ flow rate, influent
$Q_{e}=$ effluent flow rate,
$Q_{w}=$ waste sludge flow rate,
$\rho_{s}=$ wet sludge density,
$R=$ recycle ratio $=Q_{R} / Q_{o}$
$Q_{R}=$ recycle flow rate $=Q_{o} R$,
$X_{e}=$ effluent suspended solids concentration,
$X_{w}=$ waste sludge suspended solids concentration,
$V=$ tank volume,
$V_{A}=$ aeration basin volume,
$Q=$ flow rate.

DESIGN AND OPERATIONAL PARAMETERS FOR ACTIVATED-SLUDGE
TREATMENT OF MUNICIPAL WASTEWATER

| Type of Process | Mean cell residence time $\left(\theta_{c}, \mathrm{~d}\right)$ | $\begin{aligned} & \text { Food-to-mass ratio } \\ & (\mathrm{kg} \text { BOD } / \mathrm{kg} \\ & \text { MLSS }) \end{aligned}$ | Volumetric loading ( $V_{L}$ kg $\mathrm{BOD}_{5} / \mathrm{m}^{3}$ ) | Hydraulic retention time in aeration basin $(\theta, \mathrm{h})$ | Mixed liquor suspended solids (MLSS, $\mathrm{mg} / \mathrm{L}$ ) | Recycle ratio $\left(Q_{r} / Q\right)$ | Flow regime* | $\mathrm{BOD}_{5}$ <br> removal efficiency (\%) | Air supplied $\begin{aligned} & \left(\mathrm{m}^{3} / \mathrm{kg}\right. \\ & \left.\mathrm{BOD}_{5}\right) \end{aligned}$ |

*PF = plug flow, $\mathrm{CM}=$ completely mixed.

## Facultative Pond

BOD Loading
Mass ( $\mathrm{lb} /$ day ) $=$ Flow $(\mathrm{MGD}) \times$ Concentration $(\mathrm{mg} / \mathrm{L})$

$$
\times 8.34(\mathrm{lb} / \mathrm{MGal}) /(\mathrm{mg} / \mathrm{L})
$$

Total System $\leq 35$ pounds $\mathrm{BOD}_{5} /$ acre/day
Minimum $=3$ ponds
Depth $=3-8 \mathrm{ft}$
Minimum $t=90-120$ days

## Biotower

## Fixed-Film Equation without Recycle

$$
\frac{S_{e}}{S_{o}}=e^{-k D / q^{n}}
$$

## Fixed-Film Equation with Recycle

$\frac{S_{e}}{S_{a}}=\frac{e^{-k D / q^{n}}}{(1+R)-R\left(e^{-k D / q^{n}}\right)}$
$S_{a}=\frac{S_{o}+R S_{e}}{1+R}$, where
$S_{e}=$ effluent $\mathrm{BOD}_{5}(\mathrm{mg} / \mathrm{L})$,
$S_{o}=$ influent $\mathrm{BOD}_{5}(\mathrm{mg} / \mathrm{L})$,
$D=$ depth of biotower media (m),
$q=$ hydraulic loading $\left(\mathrm{m}^{3} / \mathrm{m}^{2} / \mathrm{min}\right)$,
$=\left(Q_{o}+R Q_{o}\right) / \mathrm{A}_{\text {plan }}($ with recycle $)$,
$k=$ treatability constant; functions of wastewater and medium ( $\mathrm{min}^{-1}$ ); range $0.01-0.1$; for municipal wastewater and modular plastic media $0.06 \mathrm{~min}^{-1}$ (a) $20^{\circ} \mathrm{C}$,
$k_{T}=k_{2 o}(1.035)^{\mathrm{T}-20}$,
$n=$ coefficient relating to media characteristics; modular plastic, $\mathrm{n}=0.5$,
$R=$ recycle ratio $=Q_{0} / Q_{R}$, and
$Q_{R}=$ recycle flow rate.

## Anaerobic Digester

| Design parameters for anaerobic digesters |  |  |
| :--- | :--- | :--- |
| Parameter | Standard-rate | High-rate |
| Solids retention time, d | $30-90$ | $10-20$ |
| Volatile solids loading, $\mathrm{kg} / \mathrm{m}^{3} / \mathrm{d}$ | $0.5-1.6$ | $1.6-6.4$ |
| Digested solids concentration, $\%$ | $4-6$ | $4-6$ |
| Volatile solids reduction, \% | $35-50$ | $45-55$ |
| Gas production $\left(\mathrm{m}^{3} / \mathrm{kg}\right.$ VSS added) | $0.5-0.55$ | $0.6-0.65$ |
| Methane content, $\%$ | 65 | 65 |

Source: Adapted from Metcalf \& Eddy, Inc. [5-36]

## Standard Rate

$$
\text { Reactor Volume }=\frac{\mathrm{V}_{1}+\mathrm{V}_{2}}{2} \mathrm{t}_{\mathrm{r}}+\mathrm{V}_{2} \mathrm{t}_{\mathrm{s}}
$$

## High Rate

First stage
Reactor Volume $=V_{1} t_{r}$
Second Stage
Reactor Volume $=\frac{V_{1}+V_{2}}{2} t_{t}+V_{2} t_{s}$, where
$V_{1}=$ raw sludge input ( $\mathrm{m}^{3} /$ day $)$,
$V_{2}=$ digested sludge accumulation ( $\mathrm{m}^{3} /$ day $)$,
$t_{r}=$ time to react in a high-rate digester $=$ time to react and thicken in a standard-rate digester,
$t_{t}=$ time to thicken in a high-rate digester, and
$t_{s}=$ storage time.

## Aerobic Digestion

## Tank Volume

$$
V=\frac{Q_{i}\left(X_{i}+F S_{i}\right)}{X_{d}\left(K_{d} P_{v}+1 / \theta_{c}\right)} \text {, where }
$$

$V=$ volume of aerobic digester $\left(\mathrm{ft}^{3}\right)$,
$Q_{i}=$ influent average flowrate to digester $\left(\mathrm{ft}^{3} / \mathrm{d}\right)$,
$X_{i}=$ influent suspended solids ( $\mathrm{mg} / \mathrm{L}$ ),
$F=$ fraction of the influent $\mathrm{BOD}_{5}$ consisting of raw primary sludge (expressed as a decimal),
$S_{i}=$ influent $\mathrm{BOD}_{5}(\mathrm{mg} / \mathrm{L})$,
$X_{d}=$ digester suspended solids ( $\mathrm{mg} / \mathrm{L}$ ),
$K_{d}=$ reaction-rate constant $\left(\mathrm{d}^{-1}\right)$,
$P_{v}=$ volatile fraction of digester suspended solids (expressed as a decimal), and
$\theta_{c}=$ solids retention time (sludge age) (d).

## AIR POLLUTION

For information on Ideal Gas Law equations refer to the THERMODYNAMICS Section.

## Atmospheric Dispersion Modeling (Gaussian)

$\sigma_{y}$ and $\sigma_{z}$ as a function of downwind distance and stability class, see following figures.

$$
\begin{gathered}
C=\frac{Q}{2 \pi \mu \sigma_{y} \sigma_{z}} \exp \left(-\frac{1}{2} \frac{y^{2}}{\sigma_{y}^{2}}\right)\left[\exp \left(-\frac{1}{2} \frac{(z-H)^{2}}{\sigma_{z}^{2}}\right)\right. \\
\left.+\exp \left(-\frac{1}{2} \frac{(z+H)^{2}}{\sigma_{z}^{2}}\right)\right]
\end{gathered}
$$

where
$C=$ steady-state concentration at a point (x, y, z) $\left(\mu \mathrm{g} / \mathrm{m}^{3}\right)$,
$Q=$ emissions rate $(\mu \mathrm{g} / \mathrm{s})$,
$\sigma_{\mathrm{y}}=$ horizontal dispersion parameter $(\mathrm{m})$,
$\sigma_{z}=$ vertical dispersion parameter (m),
$\mu=$ average wind speed at stack height $(\mathrm{m} / \mathrm{s})$,
$y=$ horizontal distance from plume centerline (m),
$z=$ vertical distance from ground level (m),
$H=$ effective stack height $(\mathrm{m})=\mathrm{h}+\Delta \mathrm{h}$
where $h=$ physical stack height
$\Delta h=$ plume rise, and
$x=$ downwind distance along plume centerline (m).
Concentration downwind from elevated source

$$
C_{(\max )}=\frac{Q}{\pi \mu \sigma_{y} \sigma_{z}} e^{\left(-1 / 2 H^{2} / \sigma_{z}^{2}\right)} \text { at } \sigma_{z}=(H / 2)^{1 / 2}
$$

where variables as previous except
$C_{(\max )}=$ maximum ground-level concentration .

Atmospheric Stability Under Various Conditions

| Surface Wind Speed $^{\text {a }}$ (m/s) | Day <br> Solar Insolation |  |  | Night Cloudiness ${ }^{\text {e }}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |
|  | Strong ${ }^{\text {b }}$ |  | Slight ${ }^{\text {d }}$ | Cloudy | Clear |
|  |  | Moderate ${ }^{\text {c }}$ |  | ( $\geq 4 / 8$ ) | $(\leq 3 / 8)$ |
| <2 | A | A-B ${ }^{\text {f }}$ | B | E | F |
| 2-3 | A-B | B | C | E | F |
| 3-5 | B | B-C | C | D | E |
| 5-6 | C | C-D | D | D | D |
| >6 | C | D | D | D | D |

Notes:
a. Surface wind speed is measured at 10 m above the ground.
b. Corresponds to clear summer day with sun higher than $60^{\circ}$ above the horizon.
c. Corresponds to a summer day with a few broken clouds, or a clear day with sun $35-60^{\circ}$ above the horizon.
d. Corresponds to a fall afternoon, or a cloudy summer day, or clear summer day with the sun $15-35^{\circ}$.
e. Cloudiness is defined as the fraction of sky covered by the clouds.
f. For A-B, B-C, or C-D conditions, average the values obtained for each.

$$
\begin{array}{ll}
\text { * } \quad \text { A }=\text { Very unstable } & \text { D }=\text { Neutral } \\
\mathrm{B}=\text { Moderately unstable } & \mathrm{E}=\text { Slightly stable } \\
\mathrm{C}=\text { Slightly unstable } & \mathrm{F}=\text { Stable }
\end{array}
$$

Regardless of wind speed, Class D should be assumed for overcast conditions, day or night.
SOURCE: Turner, 1970.

VERTICAL STANDARD DEVIATIONS OF A PLUME

HORIZONTAL STANDARD DEVIATIONS OF A PLUME
A - EXTREMELY UNSTABLE
B - MODERATELY UNSTABLE
C - SLIGHTLY UNSTABLE
D - NEUTRAL
E - SLIGHTLY STABLE
F - MODERATELY STABLE

NOTE: Effective stack height shown on curves numerically.
SOURCE: Turner, D. B., "Workbook of Atmospheric Dispersion Estimates," Washington, DC, U.S. Environmental Protection Agency, 1970.

$$
\left(\frac{C_{u}}{Q}\right) \max =\mathrm{e}^{\left[a+b \ln H+c(\ln H)^{2}+d(\ln H)^{3}\right]}
$$

$H=$ effective stack height, stack height + plume rise, m

Values of Curve-Fit Constants for Estimating $(\mathbf{C u} / Q)_{\text {max }}$ from $H$ as a Function of Atmospheric Stability

|  | Constants |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Stability | $a$ | $b$ | $c$ | $d$ |
| A | -1.0563 | -2.7153 | 0.1261 | 0 |
| B | -1.8060 | -2.1912 | 0.0389 | 0 |
| C | -1.9748 | -1.9980 | 0 | 0 |
| D | -2.5302 | -1.5610 | -0.0934 | 0 |
| E | -1.4496 | -2.5910 | 0.2181 | -0.0343 |
| F | -1.0488 | -3.2252 | 0.4977 | -0.0765 |

## Incineration

$$
\text { DRE }=\frac{W_{\text {in }}-W_{\text {out }}}{W_{\text {in }}} \times 100 \%, \text { where }
$$

DRE = destruction and removal efficiency (\%),
$W_{\text {in }} \quad=$ mass feed rate of a particular POHC ( $\mathrm{kg} / \mathrm{h}$ or $\mathrm{lb} / \mathrm{h}$ ), and
$W_{\text {out }} \quad=$ mass emission rate of the same POHC ( $\mathrm{kg} / \mathrm{h}$ or $\mathrm{lb} / \mathrm{h}$ ).

$$
\mathrm{CE}=\frac{\mathrm{CO}_{2}}{\mathrm{CO}_{2}+\mathrm{CO}} \times 100 \% \text {, where }
$$

$\mathrm{CO}_{2}=$ volume concentration (dry) of $\mathrm{CO}_{2}$ (parts per million, volume, ppmv),
$\mathrm{CO}=$ volume concentration (dry) of CO (ppmv),
$\mathrm{CE}=$ combustion efficiency, and
$\mathrm{POHC}=$ principal organic hazardous contaminant.

## Cyclone

## Cyclone Ratio of Dimensions to Body Diameter

| Dimension |  | High Efficiency | Conventional | High Throughput |
| :--- | :---: | :---: | :---: | :---: |
| Inlet height | H | 0.44 | 0.50 | 0.80 |
| Inlet width | W | 0.21 | 0.25 | 0.35 |
| Body length | $\mathrm{L}_{\mathrm{b}}$ | 1.40 | 1.75 | 1.70 |
| Cone length | $\mathrm{L}_{\mathrm{c}}$ | 2.50 | 2.00 | 2.00 |
| Vortex finder length | S | 0.50 | 0.60 | 0.85 |
| Gas exit diameter | $\mathrm{D}_{\mathrm{e}}$ | 0.40 | 0.50 | 0.75 |
| Dust outlet diameter | $\mathrm{D}_{\mathrm{d}}$ | 0.40 | 0.40 | 0.40 |

Cyclone Effective Number of Turns Approximation
$N_{e}=\frac{1}{H}\left[L_{b}+\frac{L_{c}}{2}\right]$, where
$N_{e}=$ number of effective turns gas makes in cyclone,
$H \quad=$ inlet height of cyclone (m),
$L_{b} \quad=$ length of body cyclone (m), and
$L_{c} \quad=$ length of cone of cyclone (m).
Cyclone 50\% Collection Efficiency for Particle Diameter
$d_{p c}=\left[\frac{9 \mu W}{2 \pi N_{e} v_{i}\left(\rho_{p}-\rho_{g}\right)}\right]^{0.5}$, where
$d_{p c}=$ diameter of particle that is collected with $50 \%$ efficiency (m),
$\mu \quad=$ viscosity of gas ( $\mathrm{kg} / \mathrm{m}-\mathrm{s}$ ),
$W \quad=$ inlet width of cyclone (m),
$N_{e} \quad=$ number of effective turns gas makes in cyclone,
$v_{i} \quad=$ inlet velocity into cyclone ( $\mathrm{m} / \mathrm{s}$ ),
$\rho_{p} \quad=$ density of particle $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$, and
$\rho_{g} \quad=$ density of gas $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$.
Cyclone Collection Efficiency

Cyclone Collection (Particle Removal) Efficiency

$$
\eta=\frac{1}{1+\left(d_{p c} / d_{p}\right)^{2}}, \text { where }
$$

$d_{p c}=$ diameter of particle collected with $50 \%$ efficiency,
$d_{p}=$ diameter of particle of interest, and
$\eta=$ fractional particle collection efficiency.

## Bag House

| Air-to-Cloth Ratio for Baghouses |  |  |

## Electrostatic Precipitator Efficiency

Deutsch-Anderson equation:

$$
\eta=1-e^{(-w A / Q)} \text {, where }
$$

$\eta=$ fractional collection efficiency,
$W=$ terminal drift velocity,
$A=$ total collection area, and
$Q=$ volumetric gas flow rate.
Note that any consistent set of units can be used for $W, A$, and $Q$ (for example, $\mathrm{ft} / \mathrm{min}, \mathrm{ft}^{2}$, and $\mathrm{ft}^{3} / \mathrm{min}$ ).

## NOISE POLLUTION

$\operatorname{SPL}(\mathrm{dB})=10 \log _{10}\left(P^{2} / P_{o}^{2}\right)$
$\mathrm{SPL}_{\text {total }}=10 \log _{10} \Sigma 10^{\mathrm{SPL} / 10}$
Point Source Attenuation
$\Delta \operatorname{SPL}(\mathrm{dB})=10 \log _{10}\left(\mathrm{r}_{1} / \mathrm{r}_{2}\right)^{2}$
Line Source Attenuation
$\Delta \operatorname{SPL}(\mathrm{dB})=10 \log _{10}\left(\mathrm{r}_{1} / \mathrm{r}_{2}\right)$
where
SPL (dB) = sound pressure level, measured in decibels
$\mathrm{P} \quad=$ sound pressure $(\mathrm{Pa})$
$\mathrm{P}_{0} \quad=$ reference sound pressure $\left(2 \times 10^{-5} \mathrm{~Pa}\right)$
$\mathrm{SPL}_{\text {total }}=$ sum of multiple sources
$\Delta \mathrm{SPL}(\mathrm{dB})=$ change in sound pressure level with distance
$\mathrm{r}_{1} \quad=$ distance from source to receptor $\Delta \mathrm{t}$ point 1
$\mathrm{r}_{2} \quad=$ distance from source to receptor $\Delta \mathrm{t}$ point 2

## RADIATION HALF-LIFE

$N=N_{o} e^{-0.693 t / \tau}$, where
$N_{o}=$ original number of atoms,
$N=$ final number of atoms,
$t=$ time, and
$\tau=$ half-life.
Flux at distance $2=($ Flux at distance 1$)\left(r_{1} / r_{2}\right)^{2}$

## RISK ASSESSMENT

Risk is a product of toxicity and exposure.
Risk assessment process

Dose is expressed as the mass intake of the chemical normalized to the body weight of the exposed individual and the time period of exposure.
NOAEL $=$ No Observable Adverse Effect Level. The dose below which there are no harmful effects.
CSF $=$ Cancer Slope Factor. Determined from the dose-response curve for carcinogenic materials.

## Exposure and Intake Rates

Soil Ingestion Rate
$100 \mathrm{mg} /$ day ( $>6$ years old)
$200 \mathrm{mg} /$ day (children 1 to 6 years old)
Exposure Duration
30 years at one residence (adult)
6 years (child)
Body Mass
70 kg (adult)
10 kg (child)
Averaging Period
non-carcinogens, actual exposure duration
carcinogens, 70 years
Water Consumption Rate
2.0 L/day (adult)
1.0 L/day (child)

Inhalation Rate
$0.83 \mathrm{~m}^{3} / \mathrm{hr}$ (adult)
$0.46 \mathrm{~m}^{3} / \mathrm{hr}$ (child)

Determined from the Noncarcinogenic Dose-Response Curve Using NOAEL
$\mathrm{RfD}=\mathrm{NOAEL} / \mathrm{a}$ safety factor
Exposure assessment calculates the actual or potential dose that an exposed individual receives and delineates the affected population by identifying possible exposure paths.
Daily Dose $(\mathrm{mg} / \mathrm{kg}$-day $)=\frac{(C)(I)(E F)(E D)(A F)}{(A T)(B W)}$, where
$C=$ concentration (mass/volume),
$I \quad=$ intake rate (volume/time),
$E F=$ exposure frequency (time/time),
$E D=$ exposure duration (time),
$A F=$ absorption factor (mass/mass),
$A T \quad=$ averaging time (time),
$B W=$ body weight (mass), and
$L A D D=$ lifetime average daily dose (daily dose, in $\mathrm{mg} / \mathrm{kg}-\mathrm{d}$, over an assumed 70-year lifetime).

## Risk

Risk characterization estimates the probability of adverse incidence occurring under conditions identified during exposure assessment.

For carcinogens the added risk of cancer is calculated as follows:

Risk $=$ dose $\times$ toxicity $=$ daily dose $\times$ CSF
For noncarcinogens, a hazard index (HI) is calculated as follows:
$\mathrm{HI}=$ intake rate/RfD

## Risk Management

Carcinogenic risk between $10^{-4}$ and $10^{-6}$ is deemed acceptable by the U.S. EPA.
For noncarcinogens, a HI greater than 1 indicates that an unacceptable risk exists.

## SAMPLING AND MONITORING

For information about Student $t$-Distribution, Standard Deviation, and Confidence Intervals, refer to the MATHEMATICS section.

## FATE AND TRANSPORT

## Partition Coefficients

Octanol-Water Partition Coefficient
The ratio of a chemical's concentration in the octanol phase to its concentration in the aqueous phase of a two-phase octanol-water system.

$$
K_{\mathrm{o} w}=C_{\mathrm{o}} / C_{w}, \text { where }
$$

$C_{\mathrm{o}}=$ concentration of chemical in octanol phase $(\mathrm{mg} / \mathrm{L}$ or $\mu \mathrm{g} / \mathrm{L}$ ) and
$C_{w}=$ concentration of chemical in aqueous phase $(\mathrm{mg} / \mathrm{L}$ or $\mu \mathrm{g} / \mathrm{L})$.

Soil-Water Partition Coefficient $K_{\underline{s w}}=K_{\varrho}$
$K_{s w}=X / C$, where
$X=$ concentration of chemical in soil ( ppb or $\mu \mathrm{g} / \mathrm{kg}$ ), and
$C=$ concentration of chemical in water $(\mathrm{ppb}$ or $\mu \mathrm{g} / \mathrm{kg})$.
Organic Carbon Partition Coefficient $K_{\underline{o c}}$
$K_{o c}=C_{\text {soil }} / C_{\text {water }}$, where
$C_{\text {soil }}=$ concentration of chemical in organic carbon component of soil ( $\mu \mathrm{g}$ adsorbed $/ \mathrm{kg}$ organic $C$, or $\mathrm{ppb})$, and
$C_{\text {water }}=$ concentration of chemical in water ( ppb or $\mu \mathrm{g} / \mathrm{kg}$ )
$K_{s w}=K_{o c} f_{o c}$, where
$f_{o c}=$ fraction of organic carbon in the soil (dimensionless).

## Bioconcentration Factor (BCF)

The amount of a chemical to accumulate in aquatic organisms.
$\mathrm{BCF}=C_{\text {org }} / C$, where
$C_{\text {org }}=$ equilibrium concentration in organism $(\mathrm{mg} / \mathrm{kg}$ or ppm), and
$C=$ concentration in water ( ppm ) .
$\underline{\text { Retardation Factor }=\mathrm{R}}$
$R=1+(\rho / \eta) K_{d}$, where
$\rho=$ bulk density,
$\eta=$ porosity, and
$K_{d}=$ distribution coefficient.

## LANDFILL

## Gas Flux

$$
N_{A}=\frac{D \eta^{4 / 3}\left(C_{A_{\text {atm }}}-C_{A_{\text {fill }}}\right)}{L}, \text { where }
$$

$N_{A}=$ gas flux of compound $A, \mathrm{~g} / \mathrm{cm}^{2} \cdot \mathrm{~s}\left(\mathrm{lb} \cdot \mathrm{mol} / \mathrm{ft}^{2} \cdot \mathrm{~d}\right)$,
$C_{A_{\text {atm }}}=$ concentration of compound $A$ at the surface of the landfill cover, $\mathrm{g} / \mathrm{cm}^{3}\left(\mathrm{lb} \cdot \mathrm{mol} / \mathrm{ft}^{3}\right)$,
$C_{A_{\text {fill }}}=$ concentration of compound $A$ at the bottom of the landfill cover, $\mathrm{g} / \mathrm{cm}^{3}\left(\mathrm{lb} \cdot \mathrm{mol} / \mathrm{ft}^{3}\right)$, and
$L=$ depth of the landfill cover, $\mathrm{cm}(\mathrm{ft})$.
Typical values for the coefficient of diffusion for methane and carbon dioxide are $0.20 \mathrm{~cm}^{2} / \mathrm{s}\left(18.6 \mathrm{ft}^{2} / \mathrm{d}\right)$ and 0.13 $\mathrm{cm}^{2} / \mathrm{s}\left(12.1 \mathrm{ft}^{2} / \mathrm{d}\right)$, respectively.
$D=$ diffusion coefficient, $\mathrm{cm}^{2} / \mathrm{s}\left(\mathrm{ft}^{2} / \mathrm{d}\right)$,
$\eta_{\text {gas }}=$ gas-filled porosity, $\mathrm{cm}^{3} / \mathrm{cm}^{3}\left(\mathrm{ft}^{3} / \mathrm{ft}^{3}\right)$, and
$\eta=$ total porosity, $\mathrm{cm}^{3} / \mathrm{cm}^{3}\left(\mathrm{ft}^{3} / \mathrm{ft}^{3}\right)$

## Break-Through Time for Leachate to Penetrate a Clay Liner

$$
t=\frac{d^{2} \eta}{K(d+h)}, \text { where }
$$

$t=$ breakthrough time (yr),
$d=$ thickness of clay liner ( ft ),
$\eta=$ effective porosity,
$K=$ coefficient of permeability ( $\mathrm{ft} / \mathrm{yr}$ ), and
$h=$ hydraulic head (ft).
Typical effective porosity values for clays with a coefficient of permeability in the range of $10^{-6}$ to $10^{-8} \mathrm{~cm} / \mathrm{s}$ vary from 0.1 to 0.3 .

## Soil Landfill Cover Water Balance

$$
\begin{gathered}
\Delta S_{\mathrm{LC}}=P-R-\mathrm{ET}-\mathrm{PER}_{\mathrm{sw}}, \text { where } \\
\Delta S_{\mathrm{LC}}= \\
\quad \begin{array}{l}
\text { change in the amount of water held in storage in a } \\
\\
\text { unit volume of landfill cover (in.), }
\end{array} \\
P \quad=\quad \text { amount of precipitation per unit area (in.), }
\end{gathered}
$$

$R \quad=$ amount of runoff per unit area (in.),
ET $=$ amount of water lost through evapotranspiration per unit area (in.), and
$\mathrm{PER}_{\mathrm{sw}}=$ amount of water percolating through the unit area of landfill cover into compacted solid waste (in.).

## Effect of Overburden Pressure

$$
S W_{p}=S W_{i}+\frac{p}{a+b p}
$$

where

$$
\begin{aligned}
S W_{p}= & \begin{array}{l}
\text { specific weight of the waste material at pressure } p \\
\\
\\
\left(\mathrm{lb} / \mathrm{yd}^{3}\right)(\text { typical } 1,750 \text { to } 2,150),
\end{array} \\
S W_{i}= & \begin{array}{l}
\text { initial compacted specific weight of waste } \\
\left(\mathrm{lb} / \mathrm{yd}^{3}\right)(\text { typical } 1,000)
\end{array} \\
p= & \text { overburden pressure }\left(\mathrm{lb} / \mathrm{in}^{2}\right) \\
a= & \text { empirical constant }\left(\mathrm{yd}^{3} / \mathrm{lb}\right)\left(\mathrm{lb} / \mathrm{in}^{2}\right), \text { and } \\
b= & \text { empirical constant }\left(\mathrm{yd}^{3} / \mathrm{lb}\right)
\end{aligned}
$$

## Data Quality Objectives (DQO) for Sampling Soils and Solids

| Investigation Type | Confidence Level (1- $\alpha$ ) (\%) | Power (1- $\beta$ ) (\%) | Minimum Detectable Relative Difference (\%) |
| :---: | :---: | :---: | :---: |
| Preliminary site investigation | 70-80 | 90-95 | 10-30 |
| Emergency clean-up | 80-90 | 90-95 | 10-20 |
| Planned removal and remedial response operations | 90-95 | 90-95 | 10-20 |

EPA Document "EPA/600/8-89/046" Soil Sampling Quality Assurance User's Guide, Chapter 7.
Confidence level: $1-$ (Probability of a Type I Error) $=1-\alpha=$ size probability of not making a Type I error
Power $=1-($ Probability of a Type II error $)=1-\beta=$ probability of not making a Type II error.
$\mathrm{CV}=(100 * \mathrm{~s}) / \bar{x}$
$\mathrm{CV}=$ coefficient of variation
$\mathrm{s}=$ standard deviation of sample
$\overline{\mathrm{x}}=$ sample average
Minimum Detectable Relative Difference $=$ Relative increase over background [100 $\left(\mu_{\mathrm{s}}-\mu_{\mathrm{B}}\right) / \mu_{\mathrm{B}}$ ] to be detectable with a probability ( $1-\beta$ )

Number of samples required in a one-sided one-sample $t$-test to achieve a minimum detectable relative difference at confidence level $(1-\alpha)$ and power of $(1-\beta)$

## ELECTRICAL AND COMPUTER ENGINEERING

## ELECTROMAGNETIC DYNAMIC FIELDS

The integral and point form of Maxwell's equations are

$$
\begin{aligned}
& \oint \mathbf{E} \cdot d \mathbf{l}=-\iint_{S}(\partial \mathbf{B} / \partial t) \cdot d \mathbf{S} \\
& \oint \mathbf{H} \cdot d \mathbf{l}=I_{\mathrm{enc}}+\iint_{S}(\partial \mathbf{D} / \partial t) \cdot d \mathbf{S} \\
& \oiint_{S_{V}} \mathbf{D} \cdot d \mathbf{S}=\iiint_{V} \rho d v \\
& \oiint_{S_{V}} \mathbf{B} \cdot d \mathbf{S}=0 \\
& \nabla \times \mathbf{E}=-\partial \mathbf{B} / \partial t \\
& \nabla \times \mathbf{H}=\mathbf{J}+\partial \mathbf{D} / \partial t \\
& \nabla \cdot \mathbf{D}=\rho \\
& \nabla \cdot \mathbf{B}=0
\end{aligned}
$$

The sinusoidal wave equation in $\mathbf{E}$ for an isotropic homogeneous medium is given by

$$
\nabla^{2} \mathbf{E}=-\omega^{2} \mu \varepsilon \mathbf{E}
$$

The $E M$ energy flow of a volume $V$ enclosed by the surface $S_{V}$ can be expressed in terms of the Poynting's Theorem

$$
\begin{aligned}
-\oiint_{S_{V}}(\mathbf{E} \times \mathbf{H}) \cdot d \mathbf{S} & =\iiint_{V} \mathbf{J} \cdot \mathbf{E} d v \\
& +\partial \partial t\left\{\iiint_{V}\left(\varepsilon E^{2} / 2+\mu H^{2} / 2\right) d v\right\}
\end{aligned}
$$

where the left-side term represents the energy flow per unit time or power flow into the volume $V$, whereas the $\mathbf{J} \cdot \mathbf{E}$ represents the loss in $V$ and the last term represents the rate of change of the energy stored in the $\mathbf{E}$ and $\mathbf{H}$ fields.

## LOSSLESS TRANSMISSION LINES

The wavelength, $\lambda$, of a sinusoidal signal is defined as the distance the signal will travel in one period.

$$
\lambda=\frac{U}{f}
$$

where $U$ is the velocity of propagation and $f$ is the frequency of the sinusoid.

The characteristic impedance, $Z_{o}$, of a transmission line is the input impedance of an infinite length of the line and is given by

$$
Z_{0}=\sqrt{L / C}
$$

where $L$ and $C$ are the per unit length inductance and capacitance of the line.
The reflection coefficient at the load is defined as

$$
\Gamma=\frac{Z_{L}-Z_{0}}{Z_{L}+Z_{0}}
$$

and the standing wave ratio SWR is

$$
\mathrm{SWR}=\frac{1+|\Gamma|}{1-|\Gamma|}
$$

$\beta=$ Propagation constant $=\frac{2 \pi}{\lambda}$

For sinusoidal voltages and currents:

Voltage across the transmission line:

$$
\boldsymbol{V}(d)=\boldsymbol{V}^{+} e^{j \beta d}+\boldsymbol{V}^{-} e^{-j \beta d}
$$

Current along the transmission line:

$$
\boldsymbol{I}(d)=\boldsymbol{I}^{+} e^{j \beta d}+\boldsymbol{I}^{-} e^{-j \beta d}
$$

where $\boldsymbol{I}^{+}=\boldsymbol{V}^{+} / Z_{0}$ and $\boldsymbol{I}^{-}=-\boldsymbol{V}^{-} / Z_{0}$
Input impedance at d

$$
Z_{\text {in }}(d)=Z_{0} \frac{Z_{L}+j Z_{0} \tan (\beta d)}{Z_{0}+j Z_{L} \tan (\beta d)}
$$

## AC MACHINES

The synchronous speed $n_{s}$ for AC motors is given by

$$
n_{s}=120 f / p, \text { where }
$$

$f=$ the line voltage frequency in Hz and
$p=$ the number of poles.
The slip for an induction motor is

$$
\text { slip }=\left(n_{s}-n\right) n_{s} \text {, where }
$$

$n=$ the rotational speed (rpm).

## DC MACHINES

The armature circuit of a DC machine is approximated by a series connection of the armature resistance $R_{a}$, the armature inductance $L_{a}$, and a dependent voltage source of value

$$
V_{a}=K_{a} n \phi \quad \text { volts, where }
$$

$K_{a}=$ constant depending on the design,
$n=$ is armature speed in rpm, and
$\phi=$ the magnetic flux generated by the field.
The field circuit is approximated by the field resistance $R_{f}$, in series with the field inductance $L_{f}$. Neglecting saturation, the magnetic flux generated by the field current $I_{f}$ is

$$
\phi=K_{f} I_{f} \quad \text { webers }
$$

The mechanical power generated by the armature is

$$
P_{m}=V_{a} I_{a} \quad \text { watts }
$$

where $I_{a}$ is the armature current. The mechanical torque produced is

$$
T_{m}=(60 / 2 \pi) K_{a} \phi I_{a} \text { newton-meters. }
$$

## BALANCED THREE-PHASE SYSTEMS

The three-phase line-phase relations are

$$
\begin{array}{ll}
I_{L}=\sqrt{3} I_{p} & (\text { for delta }) \\
V_{L}=\sqrt{3} V_{p} & \text { (for wye) }
\end{array}
$$

where subscripts $L / p$ denote line/phase respectively. Threephase complex power is defined by

$$
\boldsymbol{S}=P+j Q
$$

$$
\boldsymbol{S}=\sqrt{3} V_{L} I_{L}\left(\cos \theta_{p}+\mathrm{j} \sin \theta_{p}\right), \text { where }
$$

$\boldsymbol{S}=$ total complex volt-amperes,
$P=$ real power (watts),
$Q=$ reactive power (VARs), and
$\theta_{p}=$ power factor angle of each phase.

## CONVOLUTION

Continuous-time convolution:

$$
V(t)=x(t) * y(t)=\int_{-\infty}^{\infty} x(\tau) y(t-\tau) d \tau
$$

Discrete-time convolution:

$$
V[n]=x[n] * y[n]=\sum_{k=-\infty}^{\infty} x[k] y[n-k]
$$

## DIGITAL SIGNAL PROCESSING

A discrete-time, linear, time-invariant (DTLTI) system with a single input $x[n]$ and a single output $y[n]$ can be described by a linear difference equation with constant coefficients of the form

$$
y[n]+\sum_{i=1}^{k} b_{i} y[n-i]=\sum_{i=0}^{l} a_{i} x[n-i]
$$

If all initial conditions are zero, taking a z-transform yields a transfer function

$$
H(z)=\frac{Y(z)}{X(z)}=\frac{\sum_{i=0}^{l} a_{i} z^{k-i}}{z^{k}+\sum_{i=1}^{k} b_{i} z^{k-i}}
$$

Two common discrete inputs are the unit-step function $u[n]$ and the unit impulse function $\delta[n]$, where

$$
u[n]=\left\{\begin{array}{ll}
0 & n<0 \\
1 & n \geq 0
\end{array}\right\} \quad \text { and } \quad \delta[n]=\left\{\begin{array}{ll}
1 & n=0 \\
0 & n \neq 0
\end{array}\right\}
$$

The impulse response $h[n]$ is the response of a discrete-time system to $x[n]=\delta[n]$.
A finite impulse response (FIR) filter is one in which the impulse response $h[n]$ is limited to a finite number of points:

$$
h[n]=\sum_{i=0}^{k} a_{i} \delta[n-i]
$$

The corresponding transfer function is given by

$$
H(z)=\sum_{i=0}^{k} a_{i} z^{-i}
$$

where $k$ is the order of the filter.

An infinite impulse response (IIR) filter is one in which the impulse response $h[n]$ has an infinite number of points:

$$
h[n]=\sum_{i=0}^{\infty} a_{i} \delta[n-i]
$$

## COMMUNICATION THEORY CONCEPTS

Spectral characterization of communication signals can be represented by mathematical transform theory. An amplitude modulated (AM) signal form is

$$
v(t)=A_{c}[1+m(t)] \cos \omega_{c} t, \text { where }
$$

$A_{c}=$ carrier signal amplitude.
If the modulation baseband signal $m(t)$ is of sinusoidal form with frequency $\omega_{m}$ or

$$
m(t)=m \cos \omega_{m} t
$$

then $m$ is the index of modulation with $m>1$ implying overmodulation. An angle modulated signal is given by

$$
v(t)=A \cos \left[\omega_{c} t+\phi(t)\right]
$$

where the angle modulation $\phi(t)$ is a function of the baseband signal. The angle modulation form

$$
\phi(t)=k_{p} m(t)
$$

is termed phase modulation since angle variations are proportional to the baseband signal $m_{i}(t)$. Alternately

$$
\phi(t)=k_{f} \int_{-\infty}^{t} m(\tau) d \tau
$$

is termed frequency modulation. Therefore, the instantaneous phase associated with $v(t)$ is defined by

$$
\phi_{i}(t)=\omega_{c} t+k_{f} \int_{-\infty}^{t} m(\tau) d \tau
$$

from which the instantaneous frequency

$$
\omega_{i}=\frac{d \phi_{i}(t)}{d t}=\omega_{c}+k_{f} m(t)=\omega_{c}+\Delta \omega(t)
$$

where the frequency deviation is proportional to the baseband signal or

$$
\Delta \omega(t)=k_{f} m(t)
$$

These fundamental concepts form the basis of analog communication theory. Alternately, sampling theory, conversion, and PCM (Pulse Code Modulation) are fundamental concepts of digital communication.

## FOURIER SERIES

If $f(t)$ satisfies certain continuity conditions and the relationship for periodicity given by

$$
f(t)=f(t+T) \quad \text { for all } \mathrm{t}
$$

then $f(t)$ can be represented by the trigonometric and complex Fourier series given by

$$
f(t)=A_{o}+\sum_{n=1}^{\infty} A_{n} \cos n \omega_{o} t+\sum_{n=1}^{\infty} B_{n} \sin n \omega_{o} t
$$

and

$$
f(t)=\sum_{n=-\infty}^{\infty} C_{n} e^{j n \omega_{o} t} \text {, where }
$$

$\omega_{o}=2 \pi / T$
$A_{o}=(1 / T) \int_{t}^{t+T} f(\tau) d \tau$
$A_{n}=(2 / T) \int_{t}^{t+T} f(\tau) \cos n \omega_{o} \tau d \tau$
$B_{n}=(2 / T) \int_{t}^{t+T} f(\tau) \sin n \omega_{o} \tau d \tau$
$C_{n}=(1 / T) \int_{t}^{t+T} f(\tau) e^{-j n \omega_{o} \tau} d \tau$
Three useful and common Fourier series forms are defined in terms of the following graphs (with $\omega_{o}=2 \pi / T$ ).
Given:

then

$$
f_{1}(t)=\sum_{\substack{n=1 \\(\mathrm{n} \text { odd })}}^{\infty}(-1)^{(n-1) / 2}\left(4 V_{o} / n \pi\right) \cos \left(n \omega_{o} t\right)
$$

Given:

then

$$
\begin{aligned}
& f_{2}(t)=\frac{V_{o} \tau}{T}+\frac{2 V_{o} \tau}{T} \sum_{n=1}^{\infty} \frac{\sin (n \pi \tau / T)}{(n \pi \tau / T)} \cos \left(n \omega_{o} t\right) \\
& f_{2}(t)=\frac{V_{o} \tau}{T} \sum_{n=-\infty}^{\infty} \frac{\sin (n \pi \tau / T)}{(n \pi \tau / T)} e^{j n \omega_{o} t}
\end{aligned}
$$

Given:
$f_{\mathrm{s}}(\mathrm{t})=$ "a train of impulses with weights $\mathrm{A} "$
then

$$
\begin{aligned}
& f_{3}(t)=\sum_{n=-\infty}^{\infty} A \delta(t-n T) \\
& f_{3}(t)=(A / T)+(2 A / T) \sum_{n=1}^{\infty} \cos \left(n \omega_{o} t\right) \\
& f_{3}(t)=(A / T) \sum_{n=-\infty}^{\infty} e^{j n \omega_{o} t}
\end{aligned}
$$

SOLID-STATE ELECTRONICS AND DEVICES
Conductivity of a semiconductor material:

$$
\sigma=q\left(n \mu_{n}+p \mu_{p}\right), \text { where }
$$

$\mu_{n} \equiv$ electron mobility,
$\mu_{p} \equiv$ hole mobility,
$n \equiv$ electron concentration,
$p \equiv$ hole concentration, and
$q \equiv$ charge on an electron.
Doped material:

$$
\begin{aligned}
& p \text {-type material; } p_{p} \approx N_{a} \\
& n \text {-type material; } n_{n} \approx N_{d}
\end{aligned}
$$

Carrier concentrations at equilibrium

$$
\begin{aligned}
& (p)(n)=n_{i}^{2}, \text { where } \\
n_{i} \equiv & \text { intrinsic concentration. }
\end{aligned}
$$

Built-in potential (contact potential) of a $p-n$ junction:

$$
V_{0}=\frac{k T}{q} \ln \frac{N_{a} N_{d}}{n_{i}^{2}}, \text { where }
$$

Thermal voltage

$$
V_{T}=\frac{k T}{q}
$$

$N_{a}=$ acceptor concentration,
$N_{d}=$ donor concentration,
$T=$ temperature (K), and
$k=$ Boltzmann's Constant $=1.38 \times 10^{-23} \mathrm{~J} / \mathrm{K}$
Capacitance of abrupt $p-n$ junction diode

$$
C(V)=C_{o} / \sqrt{1-V / V_{b i}}, \text { where }
$$

$C_{o}=$ junction capacitance at $V=0$,
$V=$ potential of anode with respect to cathode, and
$V_{b i}=$ junction contact potential.
Resistance of a diffused layer is

$$
R=R_{\square}(L / W), \text { where }
$$

$R_{\square}=$ sheet resistance $=\rho / d$ in ohms per square
$\rho=$ resistivity,
$d=$ thickness,
$L=$ length of diffusion, and
$W=$ width of diffusion.

## NUMBER SYSTEMS AND CODES

An unsigned number of base- $r$ has a decimal equivalent $D$ defined by

$$
D=\sum_{k=0}^{n} a_{k} r^{k}+\sum_{i=1}^{m} a_{i} r^{-i}, \text { where }
$$

$a_{k}=$ the $(k+1)$ digit to the left of the radix point and
$a_{i}=$ the $i$ th digit to the right of the radix point.

## Binary Number System

In digital computers, the base-2, or binary, number system is normally used. Thus the decimal equivalent, $D$, of a binary number is given by
$\mathrm{D}=\alpha_{\mathrm{k}} 2^{\mathrm{k}}+\alpha_{\mathrm{k}-1} 2^{\mathrm{k}-1}+\ldots+\alpha_{0}+\alpha_{-1} 2^{-1}+\ldots$
Since this number system is so widely used in the design of digital systems, we use a short-hand notation for some powers of two:
$2^{10}=1,024$ is abbreviated "K" or "kilo"
$2^{20}=1,048,576$ is abbreviated " M " or "mega"
Signed numbers of base- $r$ are often represented by the radix complement operation. If $M$ is an $N$-digit value of base- $r$, the radix complement $R(M)$ is defined by

$$
R(M)=r^{N}-M
$$

The 2's complement of an $N$-bit binary integer can be written

$$
\text { 2's Complement }(M)=2^{\mathrm{N}}-\mathrm{M}
$$

This operation is equivalent to taking the 1 's complement (inverting each bit of M ) and adding one.
The following table contains equivalent codes for a four-bit binary value.

| Binary <br> Base-2 | Decimal <br> Base-10 | Hexa- <br> decimal <br> Base-16 | Octal <br> Base-8 | BCD <br> Code | Gray <br> Code |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0000 | 0 | 0 | 0 | 0 | 0000 |
| 0001 | 1 | 1 | 1 | 1 | 0001 |
| 0010 | 2 | 2 | 2 | 2 | 0011 |
| 0011 | 3 | 3 | 3 | 3 | 0010 |
| 0100 | 4 | 4 | 4 | 4 | 0110 |
| 0101 | 5 | 5 | 5 | 5 | 0111 |

## LOGIC OPERATIONS AND BOOLEAN ALGEBRA

Three basic logic operations are the "AND (•)," "OR (+)," and "Exclusive-OR $\oplus$ " functions. The definition of each function, its logic symbol, and its Boolean expression are given in the following table.

| Function <br> Inputs | A A C |  | $\mathrm{B}_{\mathrm{A}}^{-}-\square^{\text {POR }}$ |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
| $A B$ | $C=A \cdot B$ | $C=A+B$ | $C=A \oplus B$ |
| 00 | 0 | 0 | 0 |
| 01 | 0 | 1 | 1 |
| 10 | 0 | 1 | 1 |
| 11 | 1 | 1 | 0 |

As commonly used, $A$ AND $B$ is often written $A B$ or $A \cdot B$.
The not operator inverts the sense of a binary value $(0 \rightarrow 1,1 \rightarrow 0)$

NOT OPERATOR

## DeMorgan's Theorem

first theorem: $\overline{A+B}=\bar{A} \cdot \bar{B}$
second theorem: $\overline{A \cdot B}=\bar{A}+\bar{B}$
These theorems define the NAND gate and the NOR gate. Logic symbols for these gates are shown below.
NAND Gates: $\overline{A \cdot B}=\bar{A}+\bar{B}$

NOR Gates: $\overline{A+B}=\bar{A} \cdot \bar{B}$

## FLIP-FLOPS

A flip-flop is a device whose output can be placed in one of two states, 0 or 1 . The flip-flop output is synchronized with a clock (CLK) signal. $Q_{n}$ represents the value of the flip-flop output before CLK is applied, and $Q_{n+1}$ represents the output after CLK has been applied. Three basic flip-flops are described below.

| Composite Flip-Flop State Transition |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{Q}_{\boldsymbol{n}}$ | $\boldsymbol{Q}_{\boldsymbol{n}+\boldsymbol{1}}$ | $\boldsymbol{S}$ | $\boldsymbol{R}$ | $\boldsymbol{J}$ | $\boldsymbol{K}$ | $\boldsymbol{D}$ |

## Switching Function Terminology

Minterm, $m_{i}$ - A product term which contains an occurrence of every variable in the function.
Maxterm, $\mathrm{M}_{\mathrm{i}}$ - A sum term which contains an occurrence of every variable in the function.

Implicant - A Boolean algebra term, either in sum or product form, which contains one or more minterms or maxterms of a function.
Prime Implicant - An implicant which is not entirely contained in any other implicant.

Essential Prime Implicant - A prime implicant which contains a minterm or maxterm which is not contained in any other prime implicant.

A function can be described as a sum of minterms using the notation

$$
\begin{aligned}
\mathrm{F}(\mathrm{ABCD}) & =\Sigma \mathrm{m}(\mathrm{~h}, \mathrm{i}, \mathrm{j}, \ldots) \\
& =\mathrm{m}_{\mathrm{h}}+\mathrm{m}_{\mathrm{i}}+\mathrm{m}_{\mathrm{j}}+\ldots
\end{aligned}
$$

A function can be described as a product of maxterms using the notation

$$
\begin{aligned}
\mathrm{G}(\mathrm{ABCD}) & =\Pi \mathrm{M}(\mathrm{~h}, \mathrm{i}, \mathrm{j}, \ldots) \\
& =\mathrm{M}_{\mathrm{h}} \cdot \mathrm{M}_{\mathrm{i}} \cdot \mathrm{M}_{\mathrm{j}} \ldots .
\end{aligned}
$$

A function represented as a sum of minterms only is said to be in canonical sum of products (SOP) form. A function represented as a product of maxterms only is said to be in canonical product of sums (POS) form. A function in canonical SOP form is often represented as a minterm list, while a function in canonical POS form is often represented as a maxterm list.
A Karnaugh Map (K-Map) is a graphical technique used to represent a truth table. Each square in the K-Map represents one minterm, and the squares of the K-Map are arranged so that the adjacent squares differ by a change in exactly one variable. A four-variable K-Map with its corresponding minterms is shown below. K-Maps are used to simplify switching functions by visually identifying all essential prime implicants.

## Four-variable Karnaugh Map

| $A B C D$ | 00 | 01 | 11 | 10 |
| :---: | :---: | :---: | :---: | :---: |
| 00 | $\mathrm{m}_{0}$ | $\mathrm{m}_{1}$ | $\mathrm{m}_{3}$ | $\mathrm{m}_{2}$ |
| 01 | $\mathrm{m}_{4}$ | $\mathrm{m}_{5}$ | $\mathrm{m}_{7}$ | $\mathrm{m}_{6}$ |
| 11 | $\mathrm{m}_{12}$ | $\mathrm{m}_{13}$ | $\mathrm{m}_{15}$ | $\mathrm{m}_{14}$ |
| 10 | $\mathrm{m}_{8}$ | $\mathrm{m}_{9}$ | $\mathrm{m}_{11}$ | $\mathrm{m}_{10}$ |

## INDUSTRIAL ENGINEERING

## LINEAR PROGRAMMING

The general linear programming (LP) problem is:

$$
\text { Maximize } Z=c_{1} x_{1}+c_{2} x_{2}+\ldots+c_{n} x_{n}
$$

Subject to:

$$
\begin{aligned}
& a_{11} x_{1}+a_{12} x_{2}+\ldots+a_{1 n} x_{n} \leq b_{1} \\
& a_{21} x_{1}+a_{22} x_{2}+\ldots+a_{2 n} x_{n} \leq b_{2} \\
& \ldots \\
& \ldots \\
& a_{m 1} x_{1}+a_{m 2} x_{2}+\ldots+a_{m n} x_{n} \leq b_{m}
\end{aligned}
$$

where

$$
x_{1}, \ldots, x_{n} \geq 0
$$

An LP problem is frequently reformulated by inserting slack and surplus variables. Although these variables usually have zero costs (depending on the application), they can have nonzero cost coefficients in the objective function. A slack variable is used with a "less than" inequality and transforms it into an equality. For example, the inequality $5 x_{1}+3 x_{2}+2 x_{2} \leq$ 5 could be changed to $5 x_{1}+3 x_{2}+2 x_{3}+s_{1}=5$ if $s_{1}$ were chosen as a slack variable. The inequality $3 x_{1}+x_{2}-4 x_{3} \geq 10$ might be transformed into $3 x_{1}+x_{2}-4 x_{3}-s_{2}=10$ by the addition of the surplus variable $s_{2}$. Computer printouts of the results of processing and LP usually include values for all slack and surplus variables, the dual prices, and the reduced cost for each variable.

## DUAL LINEAR PROGRAM

Associated with the general linear programming problem is another problem called the dual linear programming problem. If we take the previous problem and call it the primal problem, then in matrix form the primal and dual problems are respectively:

## Primal

Maximize $Z=c \boldsymbol{x}$
Subject to: $\boldsymbol{A} \boldsymbol{x} \leq \boldsymbol{b}$

$$
x \geq 0
$$

## Dual

Minimize $W=\boldsymbol{y b}$
Subject to: $\boldsymbol{y} \boldsymbol{A} \geq \boldsymbol{c}$
$y \geq 0$
If $\boldsymbol{A}$ is a matrix of size $[m \times n]$, then $\boldsymbol{y}$ is an $[1 \times m$ ] vector, $\boldsymbol{c}$ is an $[1 \times n]$ vector, and $\boldsymbol{b}$ is an $[m \times 1]$ vector.
$\boldsymbol{x}$ is an $[n \times 1]$ vector.

## STATISTICAL QUALITY CONTROL

Average and Range Charts

| $\boldsymbol{n}$ | $\boldsymbol{A}_{\mathbf{2}}$ | $\boldsymbol{D}_{\mathbf{3}}$ | $\boldsymbol{D}_{\mathbf{4}}$ |
| :---: | :---: | :---: | :---: |
| 2 | 1.880 | 0 | 3.268 |
| 3 | 1.023 | 0 | 2.574 |
| 4 | 0.729 | 0 | 2.282 |
| 5 | 0.577 | 0 | 2.114 |
| 6 | 0.483 | 0 | 2.004 |
| 7 | 0.419 | 0.076 | 1.924 |
| 8 | 0.373 | 0.136 | 1.864 |
| 9 | 0.337 | 0.184 | 1.816 |
| 10 | 0.308 | 0.223 | 1.777 |

$X=$ an individual observation
$n=$ the sample size of a group
$k=$ the number of groups
$R=$ (range) the difference between the largest and smallest observations in a sample of size $n$.

$$
\begin{aligned}
& \bar{X}=\frac{X_{1}+X_{2}+\ldots+X_{n}}{n} \\
& \overline{\bar{X}}=\frac{\bar{X}_{1}+\bar{X}_{2}+\ldots+\bar{X}_{k}}{k} \\
& \bar{R}=\frac{R_{1}+R_{2}+\ldots+R_{k}}{k}
\end{aligned}
$$

The $R$ Chart equations are:

$$
\begin{aligned}
& C L_{R}=\bar{R} \\
& U C L_{R}=D_{4} \bar{R} \\
& L C L_{R}=D_{3} \bar{R}
\end{aligned}
$$

The $\bar{X}$ Chart equations are:

$$
\begin{aligned}
& C L_{X}=\overline{\bar{X}} \\
& U C L_{X}=\overline{\bar{X}}+A_{2} \bar{R} \\
& L C L_{X}=\overline{\bar{X}}-A_{2} \bar{R}
\end{aligned}
$$

## Standard Deviation Charts

| :--- |
| $C L_{X}=\overline{\bar{X}}$ |
| $L C L_{X}=\overline{\bar{X}}-A_{3} \bar{S}$ |
| $U C L_{S}=B_{4} \bar{S}$ |
| $C L_{S}=\bar{S}$ |
| $L C L_{S}=B_{3} \bar{S}$ |

## Approximations

The following table and equations may be used to generate initial approximations of the items indicated.

| $\boldsymbol{n}$ | $\boldsymbol{c}_{\boldsymbol{4}}$ | $\boldsymbol{d}_{\boldsymbol{2}}$ | $\boldsymbol{d}_{\mathbf{3}}$ |
| :---: | :---: | :---: | :---: |
| 2 | 0.7979 | 1.128 | 0.853 |
| 3 | 0.8862 | 1.693 | 0.888 |
| 4 | 0.9213 | 2.059 | 0.880 |
| 5 | 0.9400 | 2.326 | 0.864 |
| 6 | 0.9515 | 2.534 | 0.848 |
| 7 | 0.9594 | 2.704 | 0.833 |
| 8 | 0.9650 | 2.847 | 0.820 |
| 9 | 0.9693 | 2.970 | 0.808 |
| 10 | 0.9727 | 3.078 | 0.797 |

$\hat{\sigma}=\bar{R} / d_{2}$
$\hat{\sigma}=\bar{S} / c_{4}$
$\sigma_{R}=d_{3} \hat{\sigma}$
$\sigma_{s}=\bar{\sigma} \sqrt{1-c_{4}^{2}}$, where
$\hat{\sigma}=$ an estimate of $\sigma$,
$\sigma_{R}=$ an estimate of the standard deviation of the ranges of the samples, and
$\sigma_{S}=$ an estimate of the standard deviation of the standard deviations.

## Tests for Out of Control

1. A single point falls outside the (three sigma) control limits.
2. Two out of three successive points fall on the same side of and more than two sigma units from the center line.
3. Four out of five successive points fall on the same side of and more than one sigma unit from the center line.
4. Eight successive points fall on the same side of the center line.

## QUEUEING MODELS

## Definitions

$P_{n}=$ probability of $n$ units in system,
$L=$ expected number of units in the system,
$L_{q}=$ expected number of units in the queue,
$W=$ expected waiting time in system,
$W_{q}=$ expected waiting time in queue,
$\lambda=$ mean arrival rate (constant),
$\mu=$ mean service rate (constant),
$\rho=$ server utilization factor, and
$s=$ number of servers.
Kendall notation for describing a queueing system:
$A / B / s / M$
$A=$ the arrival process,
$B=$ the service time distribution,
$s=$ the number of servers, and
$M=$ the total number of customers including those in service.

## Fundamental Relationships

$$
\begin{aligned}
& L=\lambda W \\
& L_{q}=\lambda W_{q} \\
& W=W_{q}+1 / \mu \\
& \rho=\lambda /(s \mu)
\end{aligned}
$$

## Single Server Models ( $s=1$ )

Poisson Input-Exponential Service Time: $M=\infty$

$$
P_{0}=1-\lambda / \mu=1-\rho
$$

$$
P_{n}=(1-\rho) \rho^{n}=P_{\rho} \rho^{n}
$$

$$
\begin{aligned}
& L=\rho /(1-\rho)=\lambda /(\mu-\lambda) \\
& L_{q}=\lambda^{2} /[\mu(\mu-\lambda)] \\
& W=1 /[\mu(1-\rho)]=1 /(\mu-\lambda) \\
& W_{q}=W-1 / \mu=\lambda /[\mu(\mu-\lambda)]
\end{aligned}
$$

Finite queue: $M<\infty$

$$
\begin{aligned}
& P_{0}=(1-\rho) /\left(1-\rho^{M+1}\right) \\
& P_{n}=\left[(1-\rho) /\left(1-\rho^{M+1}\right)\right] \rho^{n} \\
& L=\rho /(1-\rho)-(M+1) \rho^{M+1} /\left(1-\rho^{M+1}\right) \\
& L_{q}=L-\left(1-P_{0}\right)
\end{aligned}
$$

Poisson Input-Arbitrary Service Time
Variance $\sigma^{2}$ is known. For constant service time, $\sigma^{2}=0$.

$$
\begin{aligned}
& P_{0}=1-\rho \\
& L_{q}=\left(\lambda^{2} \sigma^{2}+\rho^{2}\right) /[2(1-\rho)] \\
& L=\rho+L_{q} \\
& W_{q}=L_{q} / \lambda \\
& W=W_{q}+1 / \mu
\end{aligned}
$$

Poisson Input-Erlang Service Times, $\sigma^{2}=1 /\left(k \mu^{2}\right)$

$$
\begin{aligned}
L_{q} & =[(1+k) /(2 k)]\left[\left(\lambda^{2}\right) /(\mu(\mu-\lambda))\right] \\
& =\left[\lambda^{2} /\left(k \mu^{2}\right)+\rho^{2}\right] /[2(1-\rho)] \\
W_{q} & =[(1+k) /(2 k)]\{\lambda /[\mu(\mu-\lambda)]\} \\
W & =W_{q}+1 / \mu
\end{aligned}
$$

## Multiple Server Model (s>1)

Poisson Input-Exponential Service Times

$$
\begin{aligned}
P_{0} & =\left\{\sum_{n=0}^{s-1} \frac{\left(\frac{\lambda}{\mu}\right)^{n}}{n!}+\frac{\left(\frac{\lambda}{\mu}\right)^{s}}{s!}\left[\frac{1}{1-\frac{\lambda}{s \mu}}\right]\right\}^{-1} \\
& =1 /\left[\sum_{n=0}^{s-1} \frac{(s \rho)^{n}}{n!}+\frac{(s \rho)^{s}}{s!(1-\rho)}\right] \\
L_{q} & =\frac{P_{0}\left(\frac{\lambda}{\mu}\right)^{s} \rho}{s!(1-\rho)^{2}} \\
& =\frac{P_{0} s \rho^{s+1}}{s!(1-\rho)^{2}} \\
P_{n} & =P_{0}(\lambda / \mu)^{n} n! \\
P_{n} & =P_{0}(\lambda / \mu)^{n} /\left(s!s^{n-s}\right) \quad n \geq s \\
W_{q} & =L_{q} \lambda \\
W & =W_{q}+1 / \mu \\
L & =L_{q}+\lambda / \mu
\end{aligned}
$$

Calculations for $P_{0}$ and $L_{q}$ can be time consuming; however, the following table gives formulae for 1,2 , and 3 servers.

| $\boldsymbol{s}$ | $\boldsymbol{P}_{\mathbf{0}}$ | $\boldsymbol{L}_{\boldsymbol{q}}$ |
| :---: | :---: | :---: |
| 1 | $1-\rho$ | $\rho^{2} /(1-\rho)$ |
| 2 | $(1-\rho) /(1+\rho)$ | $2 \rho^{3} /\left(1-\rho^{2}\right)$ |
| 3 | $\frac{2(1-\rho)}{2+4 \rho+3 \rho^{2}}$ | $\frac{9 \rho^{4}}{2+2 \rho-\rho^{2}-3 \rho^{3}}$ |

## MOVING AVERAGE

$\hat{d}_{t}=\frac{\sum_{i=1}^{n} d_{t-i}}{n}$, where
$\hat{d}_{t}=$ forecasted demand for period $t$,
$d_{t-\mathrm{i}}=$ actual demand for $i$ th period preceding $t$, and
$n=$ number of time periods to include in the moving average.

## EXPONENTIALLY WEIGHTED MOVING AVERAGE

$\hat{d}_{t}=\alpha d_{t-1}+(1-\alpha) \hat{d}_{t-1}$, where
$\hat{d}_{t}=$ forecasted demand for $t$, and
$\alpha=$ smoothing constant

## LINEAR REGRESSION AND DESIGN OF EXPERIMENTS

## Least Squares

$y=\hat{a}+\hat{b} x$, where
$y$-intercept: $\hat{a}=\bar{y}-\hat{b} \bar{x}$,
and slope : $\hat{b}=S S_{x y} / S S_{x x}$,
$S_{x y}=\sum_{i=1}^{n} x_{i} y_{i}-(1 / n)\left(\sum_{i=1}^{n} x_{i}\right)\left(\sum_{i=1}^{n} y_{i}\right)$,
$S_{x x}=\sum_{i=1}^{n} x_{i}^{2}-(1 / n)\left(\sum_{i=1}^{n} x_{i}\right)^{2}$,
$n=$ samplesize,
$\bar{y}=(1 / n)\left(\sum_{i=1}^{n} y_{i}\right)$, and
$\bar{x}=(1 / n)\left(\sum_{i=1}^{n} x_{i}\right)$.

## Standard Error of Estimate

$$
\begin{aligned}
& S_{e}^{2}=\frac{S_{x x} S_{y y}-S_{x y}^{2}}{S_{x x}(n-2)}=M S E, \text { where } \\
& S_{y y}=\sum_{i=1}^{n} y_{i}^{2}-(1 / n)\left(\sum_{i=1}^{n} y_{i}\right)^{2}
\end{aligned}
$$

Confidence Interval for $a$

$$
\hat{a} \pm t_{\alpha / 2, n-2} \sqrt{\left(\frac{1}{n}+\frac{\bar{x}^{2}}{S_{x x}}\right) M S E}
$$

## Confidence Interval for $b$

$$
\hat{b} \pm t_{\alpha / 2, n-2} \sqrt{\frac{M S E}{S_{x x}}}
$$

## $\underline{\text { Sample Correlation Coefficient }}$

$$
r=\frac{S_{x y}}{\sqrt{S_{x x} S_{y y}}}
$$

## $2^{\mathbf{n}}$ FACTORIAL EXPERIMENTS

Factors: $\quad X_{1}, X_{2}, \ldots, X_{n}$
Levels of each factor: 1,2
$r=$ number of observations for each experimental condition (treatment),
$E_{i}=$ estimate of the effect of factor $X_{i}, i=1,2, \ldots, n$,
$E_{i j}=$ estimate of the effect of the interaction between factors $X_{i}$ and $X_{j}$,
$\bar{Y}_{i k}=$ average response value for all $\mathrm{r} 2^{\mathrm{n}-1}$ observations having $X_{i}$ set at level $k, k=1,2$, and
$\bar{Y}_{i j}^{k m}=$ average response value for all $\mathrm{r} 2^{\mathrm{n}-2}$ observations having $X_{i}$ set at level $k, k=1,2$, and $X_{j}$ set at level $m, m=1,2$.
$E_{i}=\bar{Y}_{i 2}-\bar{Y}_{i 1}$
$E_{i j}=\frac{\left(\bar{Y}_{i j}^{22}-\bar{Y}_{i j}^{21}\right)-\left(\bar{Y}_{i j}^{12}-\bar{Y}_{i j}^{11}\right)}{2}$

## ONE-WAY ANALYSIS OF VARIANCE (ANOVA)

Given independent random samples of size $n$ from $k$ populations, then:

$$
\begin{aligned}
& \sum_{i=1}^{k} \sum_{j=1}^{n}\left(x_{i j}-\bar{x}\right)^{2} \\
& \quad=\sum_{i=1}^{k} \sum_{j=1}^{n}\left(x_{i j}-\bar{x}\right)^{2}+n \sum_{i=1}^{k}\left(\bar{x}_{i}-\bar{x}\right)^{2} \quad \text { or } \\
& S S_{\text {Total }}=S S_{\text {Error }}+S S_{\text {Treatments }}
\end{aligned}
$$

Let $T$ be the grand total of all $k n$ observations and $T_{i}$ be the total of the $n$ observations of the $i$ th sample. See One-Way ANOVA table on page 149.

$$
\begin{aligned}
& C=T^{2} /(k n) \\
& S S_{\text {Total }}=\sum_{i=1}^{k} \sum_{j=1}^{n} x_{i j}^{2}-C \\
& S S_{\text {Treatments }}=\sum_{i=1}^{k}\left(T_{i}^{2} / n\right)-C \\
& S S_{\text {Error }}=S S_{\text {Total }}-S S_{\text {Treatments }}
\end{aligned}
$$

## ANALYSIS OF VARIANCE FOR $2^{\text {n }}$ FACTORIAL DESIGNS

Let $E$ be the estimate of the effect of a given factor, let $L$ be the orthogonal contrast belonging to this effect. It can be proved that

$$
\begin{aligned}
& E=\frac{L}{2^{n-1}} \\
& L=\sum_{c=1}^{m} a_{(c)} \bar{Y}_{(c)} \\
& S S_{L}=\frac{r L^{2}}{2^{n}}, \text { where }
\end{aligned}
$$

$m=$ number of experimental conditions $\left(m=2^{n}\right.$ for $n$ factors),
$a_{(c)}=-1$ if the factor is set at its low level in experimental condition $c$,
$a_{(c)}=+1$ if the factor is set at its high level in experimental condition $c$,
$r=$ number of replications for each experimental condition
$\bar{Y}_{(c)}=$ average response value for experimental condition $c$, and
$S S_{L}=$ sum of squares associated with the factor.
The sum of the squares due to the random error can be computed as

$$
S S_{\text {error }}=S S_{\text {total }}-\Sigma_{i} \Sigma_{j} S S_{i j}-\ldots-S S_{12 \ldots n}
$$

where $S S_{i}$ is the sum of squares due to factor $X_{i}, S S_{i j}$ is the sum of squares due to the interaction of factors $X_{i}$ and $X_{j}$, and so on. The total sum of squares is equal to

$$
S S_{\text {total }}=\sum_{c=1}^{m} \sum_{k=1}^{r} Y_{c k}^{2}-\frac{T^{2}}{N}
$$

where $Y_{c k}$, is the $k^{\text {th }}$ observation taken for the $c^{\text {th }}$ experimental condition, $m=2^{n}, T$ is the grand total of all observations and $N=r 2^{n}$.

## LEARNING CURVES

The time to do the repetition $N$ of a task is given by
$T_{N}=K N^{s}$, where
$K=$ constant, and
$s=\ln$ (learning rate, as a decimal)/ln 2 .
If $N$ units are to be produced, the average time per unit is given by

$$
T_{\mathrm{avg}}=\frac{K}{N(1+s)}\left[(N+0.5)^{(1+s)}-0.5^{(1+s)}\right]
$$

## INVENTORY MODELS

For instantaneous replenishment (with constant demand rate, known holding and ordering costs, and an infinite stockout cost), the economic order quantity is given by

$$
E O Q=\sqrt{\frac{2 A D}{h}}, \text { where }
$$

$A=$ cost to place one order,
$D=$ number of units used per year, and
$h=$ holding cost per unit per year.
Under the same conditions as above with a finite replenishment rate, the economic manufacturing quantity is given by

$$
E M Q=\sqrt{\frac{2 A D}{h(1-D / R)}} \text {, where }
$$

$R=$ the replenishment rate.

## ERGONOMICS

## NIOSH Formula

Recommended Weight Limit (U.S. Customary Units)
$=51(10 / \mathrm{H})(1-0.0075|\mathrm{~V}-30|)(0.82+1.8 / \mathrm{D})(1-0.0032 \mathrm{~A})$
where
$\mathrm{H}=$ horizontal distance of the hand from the midpoint of the line joining the inner ankle bones to a point projected on the floor directly below the load center,
$\mathrm{V}=$ vertical distance of the hands from the floor,
$\mathrm{D}=$ vertical travel distance of the hands between the origin and destination of the lift, and
$\mathrm{A}=$ asymmetric angle, in degrees.
The NIOSH formula as stated here assumes that (1) lifting frequency is no greater than one lift every 5 minutes; (2) the person can get a good grip on the object being lifted.

## Biomechanics of the Human Body

> Basic Equations $$
\begin{array}{l}H_{x}+F_{x}=0 \\ H_{y}+F_{y}=0 \\ H_{z}+F_{z}=0 \\ T_{H x z}+T_{F x z}=0 \\ T_{H y z}+T_{F y z}=0 \\ T_{H x y}+T_{F x y}=0\end{array}
$$

The coefficient of friction $\mu$ and the angle $\alpha$ at which the floor is inclined determine the equations at the foot.

$$
F_{x}=\mu F_{z}
$$

With the slope angle $\alpha$

$$
F_{x}=\mu F_{z} \cos \alpha
$$

Of course, when motion must be considered, dynamic conditions come into play according to Newton's Second Law. Force transmitted with the hands is counteracted at the foot. Further, the body must also react with internal forces at all points between the hand and the foot.

## FACILITY PLANNING

## Equipment Requirements

$P_{i j}=$ desired production rate for product $i$ on machine $j$, measured in pieces per production period,
$T_{i j}=$ production time for product $i$ on machine $j$, measured in hours per piece,
$C_{i j}=$ number of hours in the production period available for the production of product $i$ on machine $j$,
$M_{j}=$ number of machines of type $j$ required per production period, and
$n=$ number of products.
Therefore, $M_{j}$ can be expressed as

$$
M_{j}=\sum_{i=1}^{n} \frac{P_{i j} T_{i j}}{C_{i j}}
$$

## People Requirements

$A_{j}=\sum_{i=1}^{n} \frac{P_{i j} T_{i j}}{C_{i j}}$, where
$A_{j}=$ number of crews required for assembly operation $j$,
$P_{i j}=$ desired production rate for product $i$ and assembly operation $j$ (pieces per day),
$T_{i j}=$ standard time to perform operation $j$ on product $i$ (minutes per piece),
$C_{i j}=$ number of minutes available per day for assembly operation $j$ on product $i$, and
$n=$ number of products.

## STANDARD TIME DETERMINATION

$S T=N T \times A F$
where
$N T=$ normal time, and
$A F=$ allowance factor.
Case 1: Allowances are based on the job time.
$A F_{\mathrm{job}}=1+A_{\mathrm{job}}$
$A_{\mathrm{job}}=$ allowance fraction (percentage) based on job time.
Case 2: Allowances are based on workday.
$A F_{\text {time }}=1 /\left(1-A_{\text {day }}\right)$
$A_{\text {day }}=$ allowance fraction (percentage) based on workday.

## Plant Location

The following is one formulation of a discrete plant location problem.
Minimize

$$
z=\sum_{i=1}^{m} \sum_{j=1}^{n} c_{i j} y_{i j}+\sum_{j=1}^{n} f_{j} x_{j}
$$

subject to

$$
\begin{aligned}
& \sum_{i=1}^{m} y_{i j} \leq m x_{j}, \quad j=1, \ldots, n \\
& \sum_{j=1}^{n} y_{i j}=1, \quad j=1, \ldots, m \\
& y_{i j} \geq 0, \text { for all } i, j \\
& x_{j}=(0,1), \text { for all } j, \text { where }
\end{aligned}
$$

$m=$ number of customers,
$n=$ number of possible plant sites,
$y_{i j}=$ fraction or portion of the demand of customer $i$ which is satisfied by a plant located at site $j ; i=1$, $\ldots, m ; j=1, \ldots, n$,
$x_{j}=1$, if a plant is located at site $j$,
$x_{j}=0$, otherwise,
$c_{i j}=$ cost of supplying the entire demand of customer $i$ from a plant located at site $j$, and
$f_{j}=$ fixed cost resulting from locating a plant at site $j$.

## Material Handling

Distances between two points $\left(x_{1}, y_{1}\right)$ and $\left(x_{1}, y_{1}\right)$ under different metrics:

Euclidean:

$$
D=\sqrt{\left(x_{1}-x_{2}\right)^{2}+\left(y_{1}-y_{2}\right)^{2}}
$$

Rectilinear (or Manhattan):

$$
D=\left|x_{1}-x_{2}\right|+\left|y_{1}-y_{2}\right|
$$

Chebyshev (simultaneous $x$ and $y$ movement):

$$
D=\max \left(\left|x_{1}-x_{2}\right|,\left|y_{1}-y_{2}\right|\right)
$$

## Line Balancing

$N_{\text {min }}=\left(O R \times \sum_{i} t_{i} / O T\right)$
$=$ Theoretical minimum number of stations
Idle Time/Station $=C T-S T$
Idle Time/Cycle $=\Sigma(C T-S T)$
Percent Idle Time $=\frac{\text { Idle Time } / \text { Cycle }}{N_{\text {actual }} \times C T} \times 100$, where
$C T=$ cycle time (time between units),
$O T=$ operating time/period,
$O R=$ output rate/period,
$S T=$ station time (time to complete task at each station),
$t_{i}=$ individual task times, and
$N=$ number of stations.

## Job Sequencing

Two Work Centers-Johnson's Rule

1. Select the job with the shortest time, from the list of jobs, and its time at each work center.
2. If the shortest job time is the time at the first work center, schedule it first, otherwise schedule it last. Break ties arbitrarily.
3. Eliminate that job from consideration.
4. Repeat 1,2 , and 3 until all jobs have been scheduled.

## CRITICAL PATH METHOD (CPM)

$d_{i j}=$ duration of activity $(i, j)$,
$C P=$ critical path (longest path),
$T=$ duration of project, and
$T=\sum_{(i, j) \in C P} d_{i j}$

## PERT

$\left(a_{i j}, b_{i j}, c_{i j}\right)=$ (optimistic, most likely, pessimistic) durations for activity $(i, j)$,
$\mu_{i j}=$ mean duration of activity $(i, j)$,
$\sigma_{i j}=$ standard deviation of the duration of activity $(i, j)$,
$\mu=$ project mean duration, and
$\sigma=$ standard deviation of project duration.

$$
\begin{aligned}
& \mu_{i j}=\frac{a_{i j}+4 b_{i j}+c_{i j}}{6} \\
& \sigma_{i j}=\frac{c_{i j}-a_{i j}}{6} \\
& \mu=\sum_{(i, j) \in C P} \mu_{i j} \\
& \sigma^{2}=\sum_{(i, j) \in C P} \sigma_{i j}^{2}
\end{aligned}
$$

## MACHINING FORMULAS

## Material Removal Rate Formulas

1. Drilling:
$M R R=(\pi / 4) D^{2} f N$, where
$D=$ drill diameter,
$f=$ feed rate, and
$N=\mathrm{rpm}$ of the drill.
Power $=M R R \times$ specific power
2. Slab Milling:

Cutting speed is the peripheral speed of the cutter
$V=\pi D N$, where
$D=$ cutter diameter, and
$N=$ cutter rpm.

Feed per tooth $f$ is given by
$f=v /(N n)$, where
$v=$ workpiece speed and
$n=$ number of teeth on the cutter.
$t=\left(l+l_{c}\right) / v$, where
$t=$ cutting time,
$l=$ length of workpiece, and
$l_{c}=$ additional length of cutter's travel
$=\sqrt{D d}$ (approximately).
If $l_{c} \ll l$
$M R R=l w d / t$, where
$d=$ depth of cut,
$w=\min$ (width of the cut, length of cutter), and cutting time $=t=l / v$.
3. Face Milling:
$M R R=$ width $\times$ depth of cut $\times$ workpiece speed
Cutting time $=\frac{\text { (workpiece length }+ \text { tool clearance })}{\text { workpiece speed }}$

$$
=\left(l+2 l_{c}\right) / V
$$

Feed $($ per tooth $)=V /(N n)$
$l_{c}=$ tool travel necessary to completely clear the workpiece; usually = tool diameter/2.

## Taylor Tool Life Formula

$V T^{n}=C$, where
$V=$ speed in surface feet per minute,
$T=$ time before the tool reaches a certain percentage of possible wear, and
$C, n=$ constants that depend on the material and on the tool.

## Work Sampling Formulas

$D=Z_{\alpha / 2} \sqrt{\frac{p(1-p)}{n}}$ and $R=Z_{\alpha / 2} \sqrt{\frac{1-p}{p n}}$, where
$p=$ proportion of observed time in an activity,
$D=$ absolute error,
$R=$ relative error $(R=D / p)$, and
$n=$ sample size.

ONE-WAY ANOVA TABLE

| Source of Variation | Degrees of <br> Freedom | Sum of <br> Squares | Mean Square | $\boldsymbol{F}$ |
| :--- | :---: | :--- | :---: | :---: |
| Between Treatments | $k-1$ | $S S_{\text {Treatments }}$ | $M S T=\frac{S S_{\text {Treatments }}}{k-1}$ | $\frac{M S T}{M S E}$ |
| Error | $k(n-1)$ | $S S_{\text {Error }}$ | $M S E=\frac{S S_{\text {Error }}}{k(n-1)}$ |  |
| Total | $k n-1$ | $S S_{\text {Total }}$ |  |  |

PROBABILITY AND DENSITY FUNCTIONS: MEANS AND VARIANCES

| Variable | Equation | Mean | Variance |
| :---: | :---: | :---: | :---: |
| Binomial Coefficient | $\binom{n}{x}=\frac{n!}{x!(n-x)!}$ |  |  |
| Binomial | $b(x ; n, p)=\binom{n}{x} p^{x}(1-p)^{n-x}$ | $n p$ | $n p(1-p)$ |
| Hyper Geometric | $h(x ; n, r, N)=\binom{r}{x} \frac{\binom{N-r}{n-x}}{\binom{N}{n}}$ | $\frac{n r}{N}$ | $\frac{r(N-r) n(N-n)}{N^{2}(N-1)}$ |
| Poisson | $f(x ; \lambda)=\frac{\lambda^{x} e^{-\lambda}}{x!}$ | $\lambda$ | $\lambda$ |
| Geometric | $g(x ; p)=p(1-p)^{x-1}$ | $1 / p$ | $(1-p) / p^{2}$ |
| Negative <br> Binomial | $f(y ; r, p)=\binom{y+r-1}{r-1} p^{r}(1-p)^{y}$ | $r / p$ | $r(1-p) / p^{2}$ |
| Multinomial | $f\left(x_{1}, \ldots x_{k}\right)=\frac{n!}{x_{1}!, \ldots, x_{k}!} p_{1}^{x_{1}} \ldots p_{k}^{x_{k}}$ | $n p_{i}$ | $n p_{i}\left(1-p_{i}\right)$ |
| Uniform | $f(x)=1 /(b-a)$ | $(a+b) / 2$ | $(b-a)^{2} / 12$ |
| Gamma | $f(x)=\frac{x^{\alpha-1} e^{-x / \beta}}{\beta^{\alpha} \Gamma(\alpha)} ; \quad \alpha>0, \beta>0$ | $\alpha \beta$ | $\alpha \beta^{2}$ |
| Exponential | $f(x)=\frac{1}{\beta} e^{-x / \beta}$ | $\beta$ | $\beta^{2}$ |
| Weibull | $f(x)=\frac{\alpha}{\beta} x^{\alpha-1} e^{-x^{\alpha} / \beta}$ | $\beta^{1 / \alpha} \Gamma[(\alpha+1) / \alpha]$ | $\beta^{2 / \alpha}\left[\Gamma\left(\frac{\alpha+1}{\alpha}\right)-\Gamma^{2}\left(\frac{\alpha+1}{\alpha}\right)\right]$ |

Table $A$. Tests on means of normal distribution-variance known.

| Hypothesis | Test Statistic | Criteria for Rejection |
| :---: | :---: | :---: |
| $\boldsymbol{H}_{0}: \mu=\mu_{0}$ |  |  |

## ERGONOMICS-HEARING

The average shifts with age of the threshold of hearing for pure tones of persons with "normal" hearing, using a 25 -year-old group as a reference group.

Equivalent sound-level contours used in determining the A-weighted sound level on the basis of an octave-band analysis. The curve at the point of the highest penetration of the noise spectrum reflects the A-weighted sound level.

Estimated average trend curves for net hearing loss at $1,000,2,000$, and $4,000 \mathrm{~Hz}$ after continuous exposure to steady noise. Data are corrected for age, but not for temporary threshold shift. Dotted portions of curves represent extrapolation from available data.

(c)

Exposure time, years

## Exposure time, years

Tentative upper limit of effective temperature (ET) for unimpaired mental performance as related to exposure time; data are based on an analysis of 15 studies. Comparative curves of tolerable and marginal physiological limits are also given.

Atmospheric Conditions

## MECHANICAL ENGINEERING

Examinees should also review the material in sections titled HEAT TRANSFER, THERMODYNAMICS, TRANSPORT PHENOMENA, FLUID MECHANICS, and COMPUTERS, MEASUREMENT, AND CONTROLS.

## REFRIGERATION AND HVAC

Two-Stage Cycle

The following equations are valid if the mass flows are the same in each stage.

$$
\begin{aligned}
& \mathrm{COP}_{\mathrm{ref}}=\frac{\dot{Q}_{\text {in }}}{\dot{W}_{\mathrm{in}, 1}+\dot{W}_{\mathrm{in}, 2}}=\frac{h_{5}-h_{8}}{h_{2}-h_{1}+h_{6}-h_{5}} \\
& \mathrm{COP}_{\mathrm{HP}}=\frac{\dot{Q}_{\mathrm{out}}}{\dot{W}_{\mathrm{in}, 1}+\dot{W}_{\mathrm{in}, 2}}=\frac{h_{5}-h_{3}}{h_{2}-h_{1}+h_{6}-h_{5}}
\end{aligned}
$$

$$
\begin{aligned}
& C O P_{r e f}=\frac{h_{1}-h_{4}}{\left(h_{2}-h_{1}\right)-\left(h_{3}-h_{4}\right)} \\
& C O P_{H P}=\frac{h_{2}-h_{3}}{\left(h_{2}-h_{1}\right)-\left(h_{3}-h_{4}\right)}
\end{aligned}
$$

(see also THERMODYNAMICS section)

## HVAC-Pure Heating and Cooling

$$
\begin{aligned}
& \dot{Q}=\dot{m}_{a}\left(h_{2}-h_{1}\right)=\dot{m}_{a} C_{p m}\left(T_{2}-T_{1}\right)^{\top} \\
& C_{p m}=1.02 \mathrm{~kJ} /\left(\mathrm{kg} \cdot{ }^{\circ} \mathrm{C}\right)
\end{aligned}
$$

## Cooling and Dehumidification

$\omega$

$$
\begin{aligned}
& \dot{Q}_{\mathrm{out}}=\dot{m}_{a}\left[\left(h_{1}-h_{2}\right)-h_{f 3}^{\mathrm{\top}}\left(\omega_{1}-\omega_{2}\right)\right] \\
& \dot{m}_{w}=\dot{m}_{a}\left(\omega_{1}-\omega_{2}\right)
\end{aligned}
$$

## Heating and Humidification

$$
\dot{Q}_{\mathrm{in}}=\dot{m}_{a}\left[\left(h_{2}-h_{1}\right)+h_{3}\left(\omega_{2}-\omega_{1}\right)\right]
$$

$$
\dot{m}_{w}=\dot{m}_{a}\left(\omega_{2}-\omega_{1}\right)
$$

Adiabatic Humidification (evaporative cooling)

$$
\begin{aligned}
h_{2} & =h_{1}+h_{3}\left(\omega_{2}-\omega_{1}\right) \\
\dot{m}_{w} & =\dot{m}_{a}\left(\omega_{2}-\omega_{1}\right) \\
h_{3} & =h_{f} \quad \text { at } \quad T_{w b}
\end{aligned}
$$

## Adiabatic Mixing

$\omega$

$$
\begin{aligned}
\dot{m}_{a 3} & =\dot{m}_{a 1}+\dot{m}_{a 2} \\
h_{3} & =\frac{\dot{m}_{a 1} h_{1}+\dot{m}_{a 2} h_{2}}{\dot{m}_{a 3}} \\
\omega_{3} & =\frac{\dot{m}_{a 1} \omega_{1}+\dot{m}_{a 2} \omega_{2}}{\dot{m}_{a 3}}
\end{aligned}
$$

distance $\overline{13}=\frac{\dot{m}_{a 2}}{\dot{m}_{a 3}} \times$ distance $\overline{12}$ measured on psychrometric chart

## Heating Load

(see also HEAT TRANSFER section)

$\dot{Q}=$ heat transfer rate,
$A=$ wall surface area, and
$R^{\prime \prime}=$ thermal resistance.
Overall heat transfer coefficient $=U$

$$
\begin{aligned}
U & =1 / R^{\prime \prime} \\
\dot{Q} & =U A\left(T_{i}-T_{o}\right)
\end{aligned}
$$

## Cooling Load

$$
\dot{Q}=U A \text { (CLTD), where }
$$

CLTD $=$ effective temperature difference.
CLTD depends on solar heating rate, wall or roof orientation, color, and time of day.

## Infiltration

Air change method

$$
\dot{Q}=\frac{\rho_{a} c_{p} V n_{A C}}{3,600}\left(T_{i}-T_{o}\right) \text {, where }
$$

$\rho_{a}=$ air density,
$c_{P}=$ air specific heat,
$V=$ room volume,
$n_{A C}=$ number of air changes per hour,
$T_{i}=$ indoor temperature, and
$T_{o}=$ outdoor temperature.
Crack method

$$
\dot{Q}=1.2 C L\left(T_{i}-T_{o}\right)
$$

where
$C=$ coefficient, and
$L=$ crack length.

## FANS, PUMPS, AND COMPRESSORS

## Scaling Laws

(see page 44 on Similitude)

$$
\begin{aligned}
& \left(\frac{Q}{N D^{3}}\right)_{2}=\left(\frac{Q}{N D^{3}}\right)_{1} \\
& \left(\frac{\dot{m}}{\rho N D^{3}}\right)_{2}=\left(\frac{\dot{m}}{\rho N D^{3}}\right)_{1} \\
& \left(\frac{H}{N^{2} D^{2}}\right)_{2}=\left(\frac{H}{N^{2} D^{2}}\right)_{1} \\
& \left(\frac{P}{\rho N^{2} D^{2}}\right)_{2}=\left(\frac{P}{\rho N^{2} D^{2}}\right)_{1} \\
& \left(\frac{\dot{W}}{\rho N^{3} D^{5}}\right)_{2}=\left(\frac{\dot{W}}{\rho N^{3} D^{5}}\right)_{1}
\end{aligned}
$$

where
$Q=$ volumetric flow rate,
$\dot{m}=$ mass flow rate,
$H=$ head,
$P=$ pressure rise,
$\dot{W}=$ power,
$\rho=$ fluid density,
$N=$ rotational speed, and
$D=$ impeller diameter.
Subscripts 1 and 2 refer to different but similar machines or to different operating conditions of the same machine.

## Fan Characteristics

## Typical Fan Curves

backward curved

$$
\dot{W}=\frac{\Delta P Q}{\eta_{f}} \text {, where }
$$

$\dot{W}=$ fan power,
$\Delta P=$ pressure rise, and
$\eta_{f}=$ fan efficiency.

## Pump Characteristics

Net Positive Suction Head (NPSH)
NPSH $=\frac{P_{i}}{\rho g}+\frac{V_{i}^{2}}{2 g}-\frac{P_{v}}{\rho g}$, where
$P_{i}=$ inlet pressure to pump,
$V_{i}=$ velocity at inlet to pump, and
$P_{v}=$ vapor pressure of fluid being pumped.

$$
\dot{W}=\frac{\rho g H Q}{\eta} \text {, where }
$$

$\dot{W}=$ pump power,
$\eta=$ pump efficiency, and
$H=$ head increase.

## Compressor Characteristics

where
$\dot{m} \quad=$ mass flow rate and
$P_{e} / P_{i}=$ exit to inlet pressure ratio.

$$
\begin{aligned}
\dot{W} & =\dot{m}\left(h_{e}-h_{i}+\frac{V_{e}^{2}-V_{i}^{2}}{2}\right) \\
& =\dot{m}\left(c_{p}\left(T_{e}-T_{i}\right)+\frac{V_{e}^{2}-V_{i}^{2}}{2}\right)
\end{aligned}
$$

where
$\dot{W} \quad=$ input power,
$h_{e}, h_{i}=$ exit, inlet enthalpy,
$V_{e}, V_{i}=$ exit, inlet velocity,
$c_{P} \quad=$ specific heat at constant pressure, and
$T_{e}, T_{i}=$ exit, inlet temperature.

$$
\begin{aligned}
& h_{e}=h_{i}+\frac{h_{e s}-h_{i}}{\eta} \\
& T_{e}=T_{i}+\frac{T_{e s}-T_{i}}{\eta}, \text { where }
\end{aligned}
$$

$h_{e s}=$ exit enthalpy after isentropic compression,
$T_{e s}=$ exit temperature after isentropic compression, and
$\eta=$ compression efficiency.

ENERGY CONVERSION AND POWER PLANTS (see also THERMODYNAMICS section)

## Internal Combustion Engines

 OTTO CYCLE (see THERMODYNAMICS section)
## Diesel Cycle

$\mathrm{r}=V_{1} / V_{2}$
$\mathrm{r}_{c}=V_{3} / V_{2}$
$\eta=1-\frac{1}{r^{k-1}}\left[\frac{r_{c}^{k}-1}{k\left(r_{c}-1\right)}\right]$
$k=c_{P} / c_{v}$

## Brake Power

$$
\dot{W}_{b}=2 \pi T N=2 \pi F R N, \text { where }
$$

$\dot{W}_{b}=$ brake power $(\mathrm{W})$,
$T=$ torque $(\mathrm{N} \cdot \mathrm{m})$,
$N=$ rotation speed (rev/s),
$F=$ force at end of brake $\operatorname{arm}(\mathrm{N})$, and
$R=$ length of brake arm (m).

Indicated Power

$$
\dot{W}_{i}=\dot{W}_{b}+\dot{W}_{f} \text {, where }
$$

$\dot{W}_{i}=$ indicated power (W), and
$\dot{W}_{f}=$ friction power (W).

## Brake Thermal Efficiency

$\eta_{b}=\frac{\dot{W}_{b}}{\dot{m}_{f}(H V)}$, where
$\eta_{b}=$ brake thermal efficiency,
$\dot{m}_{f}=$ fuel consumption rate ( $\mathrm{kg} / \mathrm{s}$ ), and
$H V=$ heating value of fuel $(\mathrm{J} / \mathrm{kg})$.
Indicated Thermal Efficiency

$$
\eta_{i}=\frac{\dot{W}_{i}}{\dot{m}_{f}(H V)}
$$

## Mechanical Efficiency

$$
\eta_{m}=\frac{\dot{W}_{b}}{\dot{W}_{i}}=\frac{\eta_{b}}{\eta_{i}}
$$

## Displacement Volume

$$
V_{d}=\pi B^{2} S, \mathrm{~m}^{3} \text { for each cylinder }
$$

$$
\text { Total volume }=V_{t}=V_{d}+V_{c}, \mathrm{~m}^{3}
$$

$V_{c}=$ clearance volume $\left(\mathrm{m}^{3}\right)$.

## Compression Ratio

$$
r_{c}=V_{t} / V_{c}
$$

## Mean Effective Pressure (MEP)

mep $=\frac{\dot{W} n_{s}}{V_{d} n_{c} N}$, where
$n_{s}=$ number of crank revolutions per power stroke,
$n_{c}=$ number of cylinders, and
$V_{d}=$ displacement volume per cylinder.
mep can be based on brake power (bmep), indicated power (imep), or friction power (fieep).

Volumetric Efficiency

$$
\eta_{v}=\frac{2 \dot{m}_{a}}{\rho_{a} V_{d} n_{c} N} \text { (four-stroke cycles only) }
$$

where
$\dot{m}_{a}=$ mass flow rate of air into engine ( $\mathrm{kg} / \mathrm{s}$ ), and
$\rho_{a}=$ density of air $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$.

## Specific Fuel Consumption (SFC)

$$
s f c=\frac{\dot{m}_{f}}{\dot{W}}=\frac{1}{\eta H V}, \quad \mathrm{~kg} / \mathrm{J}
$$

Use $\eta_{b}$ and $\dot{W}_{b}$ for $b s f c$ and $\eta_{i}$ and $\dot{W}_{i}$ for $i s f c$.

## Gas Turbines

Brayton Cycle (Steady-Flow Cycle)

$w_{12}=h_{1}-h_{2}=c_{P}\left(T_{1}-T_{2}\right)$
$w_{34}=h_{3}-h_{4}=c_{P}\left(T_{3}-T_{4}\right)$
$w_{\text {net }}=w_{12}+w_{34}$
$q_{23}=h_{3}-h_{2}=c_{P}\left(T_{3}-T_{2}\right)$
$q_{41}=h_{1}-h_{4}=c_{P}\left(T_{1}-T_{4}\right)$
$q_{\text {net }}=q_{23}+q_{41}$
$\eta=w_{\text {net }} / q_{23}$

## Brayton Cycle With Regeneration

S
$h_{3}-h_{2}=h_{5}-h_{6}$ or
$T_{3}-T_{2}=T_{5}-T_{6}$
$q_{34}=h_{4}-h_{3}=c_{P}\left(T_{4}-T_{3}\right)$
$q_{56}=h_{6}-h_{5}=c_{P}\left(T_{6}-T_{5}\right)$
$\eta=w_{\text {net }} / q_{34}$
Regenerator efficiency

$$
\begin{aligned}
& \eta_{\text {reg }}=\frac{h_{3}-h_{2}}{h_{5}-h_{2}}=\frac{T_{3}-T_{2}}{T_{5}-T_{2}} \\
& h_{3}=h_{2}+\eta_{\text {reg }}\left(h_{5}-h_{2}\right) \\
\text { or } \quad & T_{3}=T_{2}+\eta_{\text {reg }}\left(T_{5}-T_{2}\right)
\end{aligned}
$$

## Steam Power Plants

## Feedwater Heaters

$$
\dot{m}_{1} h_{1}+\dot{m}_{2} h_{2}=h_{3}\left(\dot{m}_{1}+\dot{m}_{2}\right)
$$

## Steam Trap

Junction

Pump

$$
\begin{aligned}
& w=h_{1}-h_{2}=\left(h_{1}-h_{2 s}\right) / \eta_{p} \\
& h_{2 s}-h_{1}=v\left(P_{2}-P_{1}\right) \\
& w=-\frac{v\left(P_{2}-P_{1}\right)}{\eta_{p}}
\end{aligned}
$$

## MACHINE DESIGN

## Variable Loading Failure Theories

Modified Goodman Theory: The modified Goodman criterion states that a fatigue failure will occur whenever

$$
\frac{\sigma_{a}}{S_{e}}+\frac{\sigma_{m}}{S_{u t}} \geq 1 \quad \text { or } \quad \frac{\sigma_{\max }}{\mathrm{Sy}} \geq 1, \quad \sigma_{m} \geq 0, \text { where }
$$

$S_{e}=$ fatigue strength,
$S_{u t}=$ ultimate strength,
$S_{y}=$ yield strength,
$\sigma_{a}=$ alternating stress, and
$\sigma_{m}=$ mean stress.
$\sigma_{\text {max }}=\sigma_{m}+\sigma_{a}$
Soderberg Theory: The Soderberg theory states that a fatigue failure will occur whenever

$$
\frac{\sigma_{a}}{S_{e}}+\frac{\sigma_{m}}{S_{y}} \geq 1, \quad \sigma_{m} \geq 0
$$

Endurance Limit: When test data is unavailable, the endurance limit for steels may be estimated as

$$
S_{e}^{\prime}=\left\{\begin{array}{r}
0.5 \mathrm{~S}_{u t}, \mathrm{~S}_{u t} \leq 1,400 \mathrm{MPa} \\
700 \mathrm{MPa}, \mathrm{~S}_{u t}>1,400 \mathrm{MPa}
\end{array}\right\}
$$

Endurance Limit Modifying Factors: Endurance limit modifying factors are used to account for the differences between the endurance limit as determined from a rotating beam test, $S_{e}^{\prime}$, and that which would result in the real part, $S_{e}$.

$$
S_{e}=k_{a} k_{b} k_{c} k_{d} k_{e} S_{e}^{\prime}
$$

where
Surface Factor, $k_{a}: k_{a}=a S_{u t}^{b}$

| Surface <br> Finish | Factor $\boldsymbol{a}$ |  | Exponent <br> $\boldsymbol{b}$ |
| :--- | :---: | :---: | :---: |
|  | $\mathbf{k p s i}$ | $\mathbf{M P a}$ |  |
| Ground | 1.34 | 1.58 | -0.085 |
| Machined or <br> CD | 2.70 | 4.51 | -0.265 |
| Hot rolled | 14.4 | 57.7 | -0.718 |
| As forged | 39.9 | 272.0 | -0.995 |

## Size Factor, $k_{b}$ :

For bending and torsion:

$$
\begin{array}{cl}
\qquad \begin{array}{ll}
d \leq 8 \mathrm{~mm} ; & k_{b}=1 \\
8 \mathrm{~mm} \leq d \leq 250 \mathrm{~mm} ; & k_{b}=1.189 d_{e f f}^{-0.097} \\
d>250 \mathrm{~mm} ; & 0.6 \leq k_{b} \leq 0.75 \\
\text { For axial loading: } & k_{b}=1
\end{array} \text { : }
\end{array}
$$

Load Factor, $k_{c}$ :

$$
\begin{array}{ll}
k_{c}=0.923 & \text { axial loading, } \mathrm{S}_{\mathrm{ut}} \leq 1520 \mathrm{MPa} \\
k_{c}=1 & \text { axial loading, } \mathrm{S}_{\mathrm{ut}}>1520 \mathrm{MPa} \\
k_{c}=1 & \text { bending }
\end{array}
$$

## Temperature Factor, $\boldsymbol{k}_{d}$ :

for $\mathrm{T} \leq 450^{\circ} \mathrm{C}, k_{d}=1$
Miscellaneous Effects Factor, $k_{e}$ : Used to account for strength reduction effects such as corrosion, plating, and residual stresses. In the absence of known effects, use $k_{e}=1$.

## Shafts and Axles

Static Loading: The maximum shear stress and the von Mises stress may be calculated in terms of the loads from

$$
\begin{aligned}
& \tau_{\max }=\frac{2}{\pi d^{3}}\left[(8 M+F d)^{2}+(8 T)^{2}\right]^{1 / 2} \\
& \sigma^{\prime}=\frac{4}{\pi d^{3}}\left[(8 M+F d)^{2}+48 T^{2}\right]^{1 / 2}, \text { where } \\
& M=\text { the bending moment, } \\
& F=\text { the axial load, } \\
& T=\text { the torque, and } \\
& d=\text { the diameter. }
\end{aligned}
$$

Fatigue Loading: Using the maximum-shear-stress theory combined with the Soderberg line for fatigue, the diameter and safety factor are related by

$$
\frac{\pi d^{3}}{32}=n\left[\left(\frac{M_{m}}{S_{y}}+\frac{K_{f} M_{a}}{S_{e}}\right)^{2}+\left(\frac{T_{m}}{S_{y}}+\frac{K_{f s} T_{a}}{S_{e}}\right)^{2}\right]^{1 / 2}
$$

where
$d=$ diameter,
$n=$ safety factor,
$M_{a}=$ alternating moment,
$M_{m}=$ mean moment,
$T_{a}=$ alternating torque,
$T_{m}=$ mean torque,
$S_{e}=$ fatigue limit,
$S_{y}=$ yield strength,
$K_{f}=$ fatigue strength reduction factor, and
$K_{f s}=$ fatigue strength reduction factor for shear.

## Screws, Fasteners, and Connections

Square Thread Power Screws: The torque required to raise, $T_{R}$, or to lower, $T_{L}$, a load is given by

$$
\begin{aligned}
& T_{R}=\frac{F d_{m}}{2}\left(\frac{l+\pi \mu d_{m}}{\pi d_{m}-\mu l}\right)+\frac{F \mu_{c} d_{c}}{2}, \\
& T_{L}=\frac{F d_{m}}{2}\left(\frac{\pi \mu d_{m}-l}{\pi d_{m}+\mu l}\right)+\frac{F \mu_{c} d_{c}}{2}, \text { where }
\end{aligned}
$$

$d_{c}=$ mean collar diameter,
$d_{m}=$ mean thread diameter,
$l=$ lead,
$F=$ load,
$\mu=$ coefficient of friction for thread, and
$\mu_{c}=$ coefficient of friction for collar.
The efficiency of a power screw may be expressed as

$$
\eta=F l /(2 \pi T)
$$

Threaded Fasteners: The load carried by a bolt in a threaded connection is given by

$$
F_{b}=C P+F_{i} \quad F_{m}<0
$$

while the load carried by the members is

$$
F_{m}=(1-C) P-F_{i} \quad F_{m}<0, \text { where }
$$

$C=$ joint coefficient,
$=k_{b} /\left(k_{b}+k_{m}\right)$
$F_{b}=$ total bolt load,
$F_{i}=$ bolt preload,
$F_{m}=$ total material load,
$P=$ externally applied load,
$k_{b}=$ the effective stiffness of the bolt or fastener in the grip, and
$k_{m}=$ the effective stiffness of the members in the grip.

Bolt stiffness may be calculated from

$$
k_{b}=\frac{A_{d} A_{t} E}{A_{d} l_{t}+A_{t} l_{d}}, \text { where }
$$

$A_{d}=$ major-diameter area,
$A_{t}=$ tensile-stress area,
$E=$ modulus of elasticity,
$l_{d}=$ length of unthreaded shank, and
$l_{t}=$ length of threaded shank contained within the grip.
If all members within the grip are of the same material, member stiffness may be obtained from

$$
k_{m}=d E A e^{b(\mathrm{~d} / l)}, \text { where }
$$

$d=$ bolt diameter,
$E=$ modulus of elasticity of members, and
$l=$ grip length .
Coefficient $A$ and $b$ are given in the table below for various joint member materials.

| Material | $\boldsymbol{A}$ | $\boldsymbol{b}$ |
| :--- | :---: | :---: |
| Steel | 0.78715 | 0.62873 |
| Aluminum | 0.79670 | 0.63816 |
| Copper | 0.79568 | 0.63553 |
| Gray cast iron | 0.77871 | 0.61616 |

The approximate tightening torque required for a given preload $F_{i}$ and for a steel bolt in a steel member is given by $T=0.2 F_{i} d$.
Threaded Fasteners-Design Factors: The bolt load factor is

$$
n_{b}=\left(S_{p} A_{t}-F_{i}\right) / C P
$$

The factor of safety guarding against joint separation is

$$
n_{s}=F_{i} /[P(1-C)]
$$

Threaded Fasteners-Fatigue Loading: If the externally applied load varies between zero and $P$, the alternating stress is

$$
\sigma_{a}=C P /\left(2 A_{t}\right)
$$

and the mean stress is

$$
\sigma_{m}=\sigma_{a}+F_{i} / A_{t}
$$

## Bolted and Riveted Joints Loaded in Shear:

(a) FASTENER IN SHEAR

Failure by pure shear, (a)
$\tau=F / A$, where
$F=$ shear load, and
$A=$ cross-sectional area of bolt or rivet.

(b) MEMBER RUPTURE

Failure by rupture, (b)

$$
\sigma=F / A, \text { where }
$$

$F=$ load and
$A=$ net cross-sectional area of thinnest member.

(c) MEMBER OR FASTENER CRUSHING

Failure by crushing of rivet or member, (c)
$\sigma=F / A$, where
$F=$ load and
$A=$ projected area of a single rivet.

(d) FASTENER GROUPS

Fastener groups in shear, (d).
The location of the centroid of a fastener group with respect to any convenient coordinate frame is:

$$
\bar{x}=\frac{\sum_{i=1}^{n} A_{i} x_{i}}{\sum_{i=1}^{n} A_{i}}, \quad \bar{y}=\frac{\sum_{i=1}^{n} A_{i} y_{i}}{\sum_{i=1}^{n} A_{i}}, \text { where }
$$

$n=$ total number of fasteners,
$i=$ the index number of a particular fastener,
$A_{i}=$ cross-sectional area of the $i$ th fastener,
$x_{i}=x$-coordinate of the center of the $i$ th fastener, and
$y_{i}=y$-coordinate of the center of the $i$ th fastener.
The total shear force on a fastener is the vector sum of the force due to direct shear $P$ and the force due to the moment $M$ acting on the group at its centroid.

The magnitude of the direct shear force due to $P$ is

$$
\left|F_{1 i}\right|=\frac{P}{n} .
$$

This force acts in the same direction as $P$.
The magnitude of the shear force due to $M$ is

$$
\left|F_{2 i}\right|=\frac{M r_{i}}{\sum_{i=1}^{n} r_{i}^{2}}
$$

This force acts perpendicular to a line drawn from the group centroid to the center of a particular fastener. Its sense is such that its moment is in the same direction (CW or CCW) as $M$.

## Mechanical Springs

Helical Linear Springs: The shear stress in a helical linear spring is

$$
\tau=K_{s} \frac{8 F D}{\pi d^{3}} \text {, where }
$$

$d=$ wire diameter,
$F=$ applied force,
$D=$ mean spring diameter
$K_{s}=(2 C+1) /(2 C)$, and
$C=D / d$.
The deflection and force are related by $F=k x$ where the spring rate (spring constant) $k$ is given by

$$
k=\frac{d^{4} G}{8 D^{3} N}
$$

where $G$ is the shear modulus of elasticity and $N$ is the number of active coils. See Table of Material Properties at the end of the MECHANICS OF MATERIALS section for values of $G$.

Spring Material: The minimum tensile strength of common spring steels may be determined from

$$
S_{u t}=A / d^{m}
$$

where $S_{u t}$ is the tensile strength in MPa, $d$ is the wire diameter in millimeters, and $A$ and $m$ are listed in the following table.

| Material | ASTM | $\boldsymbol{m}$ | $\boldsymbol{A}$ |
| :--- | :---: | :---: | :---: |
| Music wire | A228 | 0.163 | 2060 |
| Oil-tempered wire | A229 | 0.193 | 1610 |
| Hard-drawn wire | A227 | 0.201 | 1510 |
| Chrome vanadium | A232 | 0.155 | 1790 |
| Chrome silicon | A401 | 0.091 | 1960 |

Maximum allowable torsional stress for static applications may be approximated as

$$
\begin{gathered}
S_{s y}=\tau=0.45 S_{u t} \text { cold-drawn carbon steel (A227, } \\
\text { A228, A229) } \\
S_{s y}=\tau=\begin{array}{c}
0.50 S_{u t} \text { hardened and tempered carbon and } \\
\text { low-alloy steels (A232, A401) }
\end{array}
\end{gathered}
$$

Compression Spring Dimensions

| Type of Spring Ends |  |  |
| :--- | :--- | :--- |
| Term | Plain | Plain and <br> Ground |
| End coils, $N_{e}$ | 0 | 1 |
| Total coils, $N_{t}$ | $N$ | $N+1$ |
| Free length, $L_{0}$ | $p N+d$ | $p(N+1)$ |
| Solid length, $L_{s}$ | $d\left(N_{t}+1\right)$ | $d N_{t}$ |
| Pitch, $p$ | $\left(L_{0}-d\right) / N$ | $L_{0}(N+1)$ |

| Term | Squared or <br> Closed | Squared and <br> Ground |
| :--- | :--- | :--- |
| End coils, $N_{e}$ | 2 | 2 |
| Total coils, $N_{t}$ | $N+2$ | $N+2$ |
| Free length, $L_{0}$ | $p N+3 d$ | $p N+2 d$ |
| Solid length, $L_{s}$ | $d\left(N_{t}+1\right)$ | $d N_{t}$ |
| Pitch, $p$ | $\left(L_{0}-3 d\right) / N$ | $\left(L_{0}-2 d\right) / N$ |

Helical Torsion Springs: The bending stress is given as

$$
\sigma=K_{i}\left[32 F r /\left(\pi d^{3}\right)\right]
$$

where $F$ is the applied load and $r$ is the radius from the center of the coil to the load.

$$
\begin{aligned}
K_{i} & =\text { correction factor } \\
& =\left(4 C^{2}-C-1\right) /[4 C(C-1)] \\
C & =D / d
\end{aligned}
$$

The deflection $\theta$ and moment $F r$ are related by

$$
F r=k \theta
$$

where the spring rate $k$ is given by

$$
k=\frac{d^{4} E}{64 D N}
$$

where $k$ has units of $\mathrm{N} \cdot \mathrm{m} / \mathrm{rad}$ and $\theta$ is in radians.
Spring Material: The strength of the spring wire may be found as was done in the section on linear springs. The allowable stress $\sigma$ is then given by

$$
\begin{aligned}
S_{y}=\sigma= & 0.78 S_{u t} \text { cold-drawn carbon steel (A227, } \\
& \text { A228, A229) } \\
S_{y}=\sigma= & 0.87 S_{u t} \text { hardened and tempered carbon and } \\
& \text { low-alloy steel (A232, A401) }
\end{aligned}
$$

## Ball/Roller Bearing Selection

The minimum required basic load rating (load for which $90 \%$ of the bearings from a given population will survive 1 million revolutions) is given by

$$
C=P L^{\frac{1}{a}} \text {, where }
$$

$C=$ minimum required basic load rating,
$P=$ design radial load,
$L=$ design life (in millions of revolutions), and
$a=3$ for ball bearings, $10 / 3$ for roller bearings.

When a ball bearing is subjected to both radial and axial loads, an equivalent radial load must be used in the equation above. The equivalent radial load is

$$
P_{e q}=X V F_{r}+Y F_{a}, \text { where }
$$

$P_{e q}=$ equivalent radial load,
$F_{r}=$ applied constant radial load, and
$F_{a}=$ applied constant axial (thrust) load.
For radial contact, groove ball bearings:
$V=1$ if inner ring rotating, 1.2 outer ring rotating,

$$
\begin{aligned}
& \text { If } F_{a} /\left(V F_{r}\right)>e, \\
& \qquad X=0.56, \text { and } \quad Y=0.840\left(\frac{F_{a}}{C_{o}}\right)^{-0.247} \\
& \text { where } \quad e=0.513\left(\frac{F_{a}}{C_{o}}\right)^{0.236}, \quad \text { and }
\end{aligned}
$$

$C_{o}=$ basic static load rating, from bearing catalog.
If $F_{a} /\left(V F_{r}\right) \leq e, \mathrm{X}=1$ and $\mathrm{Y}=0$.

## Press/Shrink Fits

The interface pressure induced by a press/shrink fit is

$$
p=\frac{0.5 \delta}{\frac{r}{E_{o}}\left(\frac{r_{o}^{2}+r^{2}}{r_{o}^{2}-r^{2}}+v_{o}\right)+\frac{r}{E_{i}}\left(\frac{r^{2}+r_{i}^{2}}{r^{2}-r_{i}^{2}}+v_{i}\right)}
$$

where the subscripts $i$ and $o$ stand for the inner and outer member, respectively, and
$p=$ inside pressure on the outer member and outside pressure on the inner member,
$\delta=$ the diametral interference,
$r=$ nominal interference radius,
$r_{i}=$ inside radius of inner member,
$r_{o}=$ outside radius of outer member,
$E=$ Young's modulus of respective member, and
$v=$ Poisson's ratio of respective member.
See the MECHANICS OF MATERIALS section on thickwall cylinders for the stresses at the interface.

The maximum torque that can be transmitted by a press fit joint is approximately

$$
T=2 \pi r^{2} \mu p l
$$

where $r$ and $p$ are defined above,
$T=$ torque capacity of the joint,
$\mu=$ coefficient of friction at the interface, and
$l=$ length of hub engagement.

## Intermediate- and Long-Length Columns

The slenderness ratio of a column is $S_{r}=l / k$, where $l$ is the length of the column and $k$ is the radius of gyration. The radius of gyration of a column cross-section is, $k=\sqrt{I / A}$
where $I$ is the area moment of inertia and $A$ is the crosssectional area of the column. A column is considered to be intermediate if its slenderness ratio is less than or equal to $\left(S_{r}\right)_{D}$, where

$$
\left(S_{r}\right)_{D}=\pi \sqrt{\frac{2 E}{S_{y}}}, \quad \text { and }
$$

$E=$ Young's modulus of respective member, and
$S_{y}=$ yield strength of the column material.
For intermediate columns, the critical load is

$$
P_{c r}=A\left[S_{y}-\frac{1}{E}\left(\frac{S_{y} S_{r}}{2 \pi}\right)^{2}\right], \text { where }
$$

$P_{c r}=$ critical buckling load,
$A=$ cross-sectional area of the column,
$S_{y}=$ yield strength of the column material,
$E=$ Young's modulus of respective member, and
$S_{r}=$ slenderness ratio.
For long columns, the critical load is

$$
P_{c r}=\frac{\pi^{2} E A}{S_{r}^{2}}
$$

where the variable area as defined above.
For both intermediate and long columns, the effective column length depends on the end conditions. The AISC recommended values for the effective lengths of columns are, for: rounded-rounded or pinned-pinned ends, $l_{\text {eff }}=l$; fixed-free, $l_{e f f}=2.1 l$; fixed-pinned, $l_{e f f}=0.80 l$; fixed-fixed, $l_{\text {eff }}=0.65 l$. The effective column length should be used when calculating the slenderness ratio.

## Gearing

Gear Trains: Velocity ratio, $m_{v}$, is the ratio of the output velocity to the input velocity. Thus, $m_{v}=\omega_{\text {out }} / \omega_{i n}$. For a two-gear train, $m_{v}=-N_{\text {in }} / N_{\text {out }}$ where $N_{\text {in }}$ is the number of teeth on the input gear and $N_{\text {out }}$ is the number of teeth on the output gear. The negative sign indicates that the output gear rotates in the opposite sense with respect to the input gear. In a compound gear train, at least one shaft carries more than one gear (rotating at the same speed). The velocity ratio for a compound train is:

$$
m_{v}= \pm \frac{\text { product of number of teeth on driver gears }}{\text { product of number of teeth on driven gears }}
$$

A simple planetary gearset has a sun gear, an arm that rotates about the sun gear axis, one or more gears (planets) that rotate about a point on the arm, and a ring (internal) gear that is concentric with the sun gear. The planet gear(s)

## MECHANICAL ENGINEERING (continued)

mesh with the sun gear on one side and with the ring gear on the other. A planetary gearset has two, independent inputs and one output (or two outputs and one input, as in a differential gearset).
Often, one of the inputs is zero, which is achieved by grounding either the sun or the ring gear. The velocities in a planetary set are related by

$$
\frac{\omega_{f}-\omega_{a r m}}{\omega_{L}-\omega_{a r m}}= \pm m_{v}, \text { where }
$$

$\omega_{f}=$ speed of the first gear in the train,
$\omega_{L}=$ speed of the last gear in the train, and
$\omega_{\text {arm }}=$ speed of the arm.
Neither the first nor the last gear can be one that has planetary motion. In determining $m_{v}$, it is helpful to invert the mechanism by grounding the arm and releasing any gears that are grounded.

Loading on Straight Spur Gears: The load, $W$, on straight spur gears is transmitted along a plane that, in edge view, is called the line of action. This line makes an angle with a tangent line to the pitch circle that is called the pressure angle $\phi$. Thus, the contact force has two components: one in the tangential direction, $W_{t}$, and one in the radial direction, $W_{r}$. These components are related to the pressure angle by

$$
W_{r}=W_{t} \tan (\phi)
$$

Only the tangential component $W_{t}$ transmits torque from one gear to another. Neglecting friction, the transmitted force may be found if either the transmitted torque or power is known:

$$
W_{t}=\frac{2 T}{d}=\frac{2 T}{m N}
$$

$$
W_{t}=\frac{2 H}{d \omega}=\frac{2 H}{m N \omega}, \text { where }
$$

$W_{t}=$ transmitted force (newton),
$T=$ torque on the gear (newton-mm),
$d=$ pitch diameter of the gear (mm),
$N=$ number of teeth on the gear,
$m=$ gear module (mm) (same for both gears in mesh),
$H=$ power $(\mathrm{kW})$, and
$\omega=$ speed of gear $(\mathrm{rad} / \mathrm{sec})$.

Stresses in Spur Gears: Spur gears can fail in either bending (as a cantilever beam, near the root) or by surface fatigue due to contact stresses near the pitch circle. AGMA Standard 2001 gives equations for bending stress and surface stress. They are:

$$
\begin{aligned}
\sigma_{b} & =\frac{W_{t}}{F m J} \frac{K_{a} K_{m}}{K_{v}} K_{s} K_{B} K_{I}, \text { bending and } \\
\sigma_{c} & =C_{p} \sqrt{\frac{W_{t}}{F I d} \frac{C_{a} C_{m}}{C_{v}} C_{s} C_{f}}, \text { surface stress, where }
\end{aligned}
$$

$\sigma_{b}=$ bending stress,
$\sigma_{c}=$ surface stress,
$W_{t}=$ transmitted load,
$F=$ face width,
$m=$ module,
$J=$ bending strength geometry factor,
$K_{a}=$ application factor,
$K_{B}=$ rim thickness factor,
$K_{1}=$ idler factor,
$K_{m}=$ load distribution factor,
$K_{s}=$ size factor,
$K_{v}=$ dynamic factor,
$C_{p}=$ elastic coefficient,
$I=$ surface geometry factor,
$d=$ pitch diameter of gear being analyzed, and
$C_{f}=$ surface finish factor.
$C_{a}, C_{m}, C_{s}$, and $C_{v}$ are the same as $K_{a}, K_{m}, K_{s}$, and $K_{v}$, respectively.

shear stress-strain, 33
shearing force and bending moment sign conventions, 35
sight distance related to curve length, 110
sight distance, crest vertical curves (metric), 112
sight distance, sag vertical curves (metric), 112
similitude, 44
simple planetary gearset, 164
Simpson's Rule, 21, 114
sine-cosine relations, 74
single server models ( $s=1$ ), 144
size factor, $\mathrm{k}_{\mathrm{b}}, 161$
slab milling, 148
sludge age, 124
Soderberg theory, 160
soil landfill cover water balance, 131
soil-water partition coefficient, 130
solids residence time, 122
solid-state electronics and devices, 136
solubility product constant, 64
source equivalents, 73
special cases of closed systems, 48
special cases of open systems, 48
special cases of steady-flow energy equation, 48
specific energy, 109
specific energy diagram, 110
specific fuel consumption (sfc), 159
sphere, 16
spiral transitions to horizontal curves, 111
spring material, 163
square thread power screws, 161
standard deviation charts, 143
standard error of estimate, 145
standard oxidation potentials for corrosion reactions, 67
standard tensile test, 70
standard time determination, 147
state functions (properties), 47
state-variable control-system models, 78
static loading, 161
static loading failure theories, 34
statically determinate truss, 23
statistical quality control, 143
steady conduction with internal energy generation, 60
steady, incompressible flow in conduits and pipes, 41
steady-state error $e_{s s}(t), 77$
steady-state mass balance for aeration basin, 122
steady-state systems, 48
steam power plants, 160
steam trap, 160
steel design (ASD, LRFD), 96
Stokes' Law, 118
stopping sight distance, 110, 111
straight line, 3, 80
straight line motion, 25
stream modeling, 117
Streeter Phelps, 117
strength reduction factors-reinforced concrete, 94
stress and strain, 34
stress, pressure, and viscosity, 38
stresses in beams, 35
stresses in spur gears, 165
stress-strain curve for mild steel, 33
stripper packing height $=Z, 122$
stripping section, 90
structural analysis, 94
subscripts, 79
superelevation of horizontal curves, 111
superheated water tables, 54
surface factor, $\mathrm{k}_{\mathrm{a}}, 161$
surface tension and capillarity, 38
surveying, 113
SVI, 122
switching function terminology, 142
systems of forces, 22

## T

tabulated characteristics, 136
tangential and normal components, 24
tangential and normal kinetics for planar problems, 25
tank volume, 123
Taylor Tool life formula, 148
Taylor's series, 8
T-beams-concrete design, 95
$t$-distribution table, 12
temperature factor, $\mathrm{k}_{\mathrm{d}}, 161$
temperature-entropy (T-s) diagram, 51
tension members, steel, 96
test
for a point of inflection, 14
for maximum, 14
for minimum, 14
testing methods, 70
tests for out of control, 144
thermal conductivity, 59
thermal deformations, 33
thermal energy reservoirs, 50
thermal processing, 70
threaded fasteners, 161
design factors, 162
fatigue loading, 162
three dimensions, 23
throttling valves \& throttling processes, 48
to evaluate surface or intermediate temperatures, 58
torsion, 35
torsional free vibration, 28
total material balance, 90
traffic flow relationships $(q=k v), 112$
transformers, 75
transient conduction using the lumped capacitance method, 61
transportation, 110
transportation models, 112
transpose, 6
transverse and radial components for planar problems, 24
trapezoidal rule, 21, 114
trigonometry, 5
turbines, pumps, compressors, 48
turbulent flow, 60
turbulent flow in circular tubes, 63
turns ratio, 75
two dimensions, 23
two work centers, 148
two-body problem, 61
two-film theory (for equimolar counter-diffusion), 91
two-stage cycle, 155
type of spring ends, 163
typical fan curves, 157
typical primary clarifier efficiency percent removal, 119
ultimate strength design-reinforced concrete, 94
ultrafiltration, 121
underdamped, 78
uniaxial loading and deformation, 33
uniaxial stress-strain, 33
unidirectional diffusion of a gas through a second stagnant gas $b\left(n_{b}=0\right), 91$
unified soil classification system, 93
unit normal distribution table, 11
units, 72
unsteady state diffusion in a gas, 91
US civilian body dimensions, female/male, for ages 20 to 60 years, 152
V
values of $t_{\alpha, n}, 12$
vapor-liquid equilibrium, 88
vapor-liquid mixtures, 50
variable loading failure theories, 160
vectors, 6
velocity gradient, 118
velocity ratio, 164
venturi meters, 43
vertical curve formulas, 115
viscosity, 38
voltage, 72, 121
volumetric efficiency, 159

## W

water, 117
water and wastewater technologies, 117
water, properties, 44
Weir formulas, 110
Weir loadings, 120
wind rose, 113
work and energy, 25
work sampling formulas, 148
Z
zero-order reaction, 89
$z$-transforms, 20
